Reproduction in any manner whatsoever without the written permission of D-Link Corporation is strictly forbidden.

Trademarks used in this text: D-Link and the D-Link logo are trademarks of D-Link Corporation; Microsoft and Windows are registered trademarks of Microsoft Corporation.

Other trademarks and trade names may be used in this document to refer to either the entities claiming the marks and names or their products. D-Link Corporation disclaims any proprietary interest in trademarks and trade names other than its own.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with this user's guide, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

CE Mark Warning

This is a Class A product. In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate measures.

Warnung!

Dies ist ein Produkt der Klasse A. Im Wohnbereich kann dieses Produkt Funkstörungen verursachen. In diesem Fall kann vom Benutzer verlangt werden, angemessene Massnahmen zu ergreifen.

Precaución!

Este es un producto de Clase A. En un entorno doméstico, puede causar interferencias de radio, en cuyo caso, puede requerirse al usuario para que adopte las medidas adecuadas.

Attention!

Ceci est un produit de classe A. Dans un environnement domestique, ce produit pourrait causer des interférences radio, auquel cas l'utilisateur devrait prendre les mesures adéquates.

Attenzione!

Il presente prodotto appartiene alla classe A. Se utilizzato in ambiente domestico il prodotto può causare interferenze radio, nel cui caso è possibile che l'utente debba assumere provvedimenti adeguati.

VCCI Warning

この装置は、クラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

1. Introduction

This manual's command descriptions are based on the software release 2.00. The commands listed here are the subset of commands that are supported by the DGS-1100 MP/MPP Series switch.

Audience

This reference manual is intended for network administrators and other IT networking professionals responsible for managing the switch by using the Web User Interface (Web UI). The Web UI is the secondary management interface to the DGS-1100 MP/MPP Series switch, which will be generally be referred to simply as 'the switch' within this manual. This manual is written in a way that assumes that you already have the experience and knowledge of Ethernet and modern networking principles for Local Area Networks.

Standard Mode and Surveillance Mode

The DGS-1100 MP/MPP series switches support Standard Mode and Surveillance Mode Web UI types. Standard Mode is used to manage the network and system elements of the switch. Surveillance Mode is a dedicated user interface designed for monitoring and managing the surveillance and IP security devices on your network.

To switch between the two types of interfaces, you can re-run the Smart Wizard that is presented when you access the web interface of the device. For more information, please refer to the Web UI Reference Guide for the appropriate mode.

Other Documentation

The documents below are a further source of information in regards to configuring and troubleshooting the switch. All the documents are available either from the CD, bundled with this switch, or from the D-Link website. Other documents related to this switch are:

- *D-Link DGS-1100 MP/MPP Series Standard Mode Web UI Reference Guide*
- *D-Link DGS-1100 MP/MPP Series Surveillance Mode Web UI Reference Guide*

Conventions

Convention	Description
Boldface Font	Indicates a button, a toolbar icon, menu, or menu item. For example: Open the File menu and choose Cancel . Used for emphasis. May also indicate system messages or prompts appearing on screen. For example: You have mail . Bold font is also used to represent filenames, program names and commands. For example: use the copy command.
Initial capital letter	Indicates a window name. Names of keys on the keyboard have initial capitals. For example: Press Enter.
Menu Name > Menu Option	Indicates the menu structure. Device > Port > Port Properties means the Port Properties menu option under the Port menu option that is located under the Device menu.
<i>Blue Courier Font</i>	This convention is used to represent an example of a screen console display including example entries of CLI command input with the corresponding output.

Notes, Notices, and Cautions

Below are examples of the three types of indicators used in this manual. When administering your switch using the information in this document, you should pay special attention to these indicators. Each example below provides an explanatory remark regarding each type of indicator.

NOTE: A note indicates important information that helps you make better use of your device.

NOTICE: A notice indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

CAUTION: A caution indicates a potential for property damage, personal injury, or death.

2. Product Introduction

The DGS-1100 MP/MPP series Smart Switch is the world's first PoE switch with ONVIF support. This allows it to recognize ONVIF devices and integrate seamlessly with your surveillance network. Various power budgets, support for high powered PoE standards (MPP series) make the DGS-1100 MP/MPP series a critical part of your surveillance infrastructure.

The DGS-1100 MP/MPP series switches can change modes between 'Smart Switch' and 'Surveillance Switch' modes, making them suitable for a variety of applications. An intuitive web user interface makes advanced features available in the Standard Mode, with full PoE capabilities and high link speeds improving deployment times for PoE devices.

The switches are designed to be energy efficient with support for IEEE 802.3az Energy Efficient Ethernet (EEE) and D-Link Green Technologies. They include multiple features, such as cable length detection, port status detection and the ability to hibernate under low utilization. If the switch detects no activity on any of the switch ports, it can be hibernated to conserve power.

The DGS-1100 MPP series provides multiple PoE ports that support IEEE 802.3bt, allowing the latest high-powered PoE devices to be used with the switch. Automatic device identification, video traffic optimization and health diagnostic tools provide an intelligent solution to your enterprise network requirements.

DGS-1100-10MP

8-Port 10/100/1000Mbps + 2-Port SFP 1000Mbps PoE switch

Front Panel

Figure 2-1 DGS-1100-10MP Front Panel

Power LED: The Power LED lights up when the switch is connected to a power source.

Link/Act/Speed LED (Ports 1-8):

Solid Green: When there is a secure 1000Mbps connection at the port.

Blinking Green or Amber: Indicates that the switch is either sending or receiving data to the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

PoE Mode (Ports 1- 8):

Green: Indicates that PoE Mode is active.

Amber: Indicates that there is an issue with the PoE mode activating properly.

Light off: Indicates that PoE mode is not active.

Link/Act/Speed LED (Ports 9-10):

Solid Green: There is a secure 1000Mbps connection at the port.

Blinking Green: There is reception or transmission occurring at the port.

Light off: No link.

LED Mode Button:

By pressing the button over 2 seconds will change LED behavior between Link Mode and PoE Mode.

Reset: By pressing the Reset button until the power LED turns amber, the switch will change back to the default configuration and all changes will be lost.

Rear Panel

Figure 2-2 DGS-1100-10MP Rear Panel

Power: Connect the supplied AC power cable to this port.

CAUTION: The SFP ports should use UL listed Optical Transceiver product, Rated Laser Class I. 3.3Vdc.

CAUTION: This equipment is to be connected only to PoE networks without routing to the outside plant.

DGS-1100-10MPP

8-Port 10/100/1000Mbps + 2-Port SFP 1000Mbps PoE switch

Front Panel

Figure 2-3 DGS-1100-10MPP Front Panel

Power LED: The Power LED lights up when the switch is connected to a power source.

Link/Act/Speed LED (Ports 1- 8):

Solid Green: When there is a secure 1000Mbps connection at the port.

Blinking Green or Amber: Indicates that the switch is either sending or receiving data to the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

PoE Mode (Ports 1- 8):

Solid Green: Indicates that PoE Mode is active.

Blinking Green: Indicates IEEE 802.3bt PD device insert and power feeding. Only apply to port 7 and port 8.

Solid Amber: Indicates that there is an issue with the PoE mode activating properly.

Light off: Indicates that PoE mode is not active.

Link/Act/Speed LED (Ports 9-10):

Solid Green: There is a secure 1000Mbps connection at the port.

Blinking Green: There is reception or transmission occurring at the port.

Light off: No link.

LED Mode Button:

By pressing the button over 2 seconds will change LED behavior between Link Mode and PoE Mode.

Reset: By pressing the Reset button until the power LED turns amber, the switch will change back to the default configuration and all changes will be lost.

Rear Panel

Figure 2-4 DGS-1100-10MPP Rear Panel

Power: Connect the supplied AC power cable to this port.

CAUTION: The SFP ports should use UL listed Optical Transceiver product, Rated Laser Class I. 3.3Vdc.

CAUTION: This equipment is to be connected only to PoE networks without routing to the outside plant.

DGS-1100-26MP

24-Port 10/100/1000Mbps + 2-Port Combo 1000BASE-T/SFP PoE switch

Front Panel

Figure 2-5 DGS-1100-26MP Front Panel

Power LED: The Power LED lights up when the switch is connected to a power source.

Link/Act/Speed LED (Ports 1-24):

Solid Green: When there is a secure 1000Mbps connection at the port.

Blinking Green or Amber: Indicates that the switch is either sending or receiving data to the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

PoE Mode (Ports 1- 24):

Green: Indicates that PoE Mode is active.

Amber: Indicates that there is an issue with the PoE mode activating properly.

Light off: Indicates that PoE mode is not active.

Link/Act/Speed LED (Ports 25-26):

Solid Green: There is a secure 1000Mbps connection at the port.

Blinking Green: There is reception or transmission occurring at the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

LED Mode Button:

By pressing the button over 2 seconds will change LED behavior between Link Mode and PoE Mode.

Reset: By pressing the Reset button until the power LED turns amber, the switch will change back to the default configuration and all changes will be lost.

Rear Panel

Figure 2-6 DGS-1100-26MP Rear Panel

Power: Connect the supplied AC power cable to this port.

CAUTION: The SFP ports should use UL listed Optical Transceiver product, Rated Laser Class I. 3.3Vdc.

CAUTION: This equipment is to be connected only to PoE networks without routing to the outside plant.

DGS-1100-26MPP

24-Port 10/100/1000 Mbps + 2-Port Combo 1000BASE-T/SFP PoE switch

Front Panel

Figure 2-7 DGS-1100-26MPP Front Panel

Power LED: The Power LED lights up when the switch is connected to a power source.

Link/Act/Speed LED (Ports 1- 24):

Solid Green: When there is a secure 1000Mbps connection at the port.

Blinking Green or Amber: Indicates that the switch is either sending or receiving data to the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

PoE Mode (Ports 1- 24):

Solid Green: Indicates that PoE Mode is active.

Blinking Green: Indicates IEEE 802.3bt PD device insert and power feeding. Only apply to port 21, 22, 23 and port 24.

Solid Amber: Indicates that there is an issue with the PoE mode activating properly.

Light off: Indicates that PoE mode is not active.

Link/Act/Speed LED (Ports 25-26):

Solid Green: There is a secure 1000Mbps connection at the port.

Blinking Green: There is reception or transmission occurring at the port.

Solid Amber: Indicates that the port is running at 10/100Mbps.

Light off: No link.

LED Mode Button:

By pressing the button over 2 seconds will change LED behavior between Link Mode and PoE Mode.

Reset: By pressing the Reset button until the power LED turns amber, the switch will change back to the default configuration and all changes will be lost.

Rear Panel

Figure 2-8 DGS-1100-26MPP Rear Panel

Power: Connect the supplied AC power cable to this port.

CAUTION: The SFP ports should use UL listed Optical Transceiver product, Rated Laser Class I. 3.3Vdc.

CAUTION: This equipment is to be connected only to PoE networks without routing to the outside plant.

3. Hardware Installation

This chapter provides unpacking and installation information for the D-Link switch.

Step1: Unpacking

Open the shipping carton and carefully unpack its contents. Please consult the packing list located below to make sure all items are present and undamaged. If any item is missing or damaged, please contact your local D-Link reseller for a replacement.

Packing Contents

- One D-Link DGS-1100 MP/MPP Series switch
- One AC power cord
- Four rubber feet
- Screws and two mounting brackets
- One accessory kit for a ground screw
- One Multi-lingual Getting Started Guide
- One CD with User Manual

Step2: Switch Installation

For safe switch installation and operation, it is recommended that you:

- Visually inspect the power cord to see that it is secured fully to the AC power connector.
- Make sure that there is proper heat dissipation and adequate ventilation around the switch.
- Do not place heavy objects on the switch.

Desktop or Shelf Installation

When installing the switch on a desktop or shelf, the rubber feet included with the device must be attached on the bottom at each corner of the device's base. Allow enough ventilation space between the device and the objects around it.

Figure 3-1 Attach the adhesive rubber pads to the bottom

Rack Installation

The switch can be mounted in an EIA standard size 19-inch rack, which can be placed in a wiring closet with other equipment.

CAUTION: Ensure the power cable is disconnected before installing the switch.

To install, attach the mounting brackets to the switch's side panels (one on each side) and secure them with the screws provided.

Figure 3-2 Attach the mounting brackets to the switch

Then, use the screws provided with the equipment rack to mount the switch in the rack.

Figure 3-3 Mount the switch in the rack or chassis

Please be aware of following safety Instructions when installing:

A) Elevated Operating Ambient - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature specified by the manufacturer.

B) Reduced Air Flow - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

C) Mechanical Loading - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

D) Circuit Overloading - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on over current protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

E) Reliable Earthing - Reliable earthing of rack-mounted equipment should be maintained. Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips).

Step 3: Plugging in the AC Power Cord

Users may now connect the AC power cord into the rear of the switch and to an electrical outlet (preferably one that is grounded and surge protected).

Figure 3-4 Plugging the switch into an outlet

Power Failure

As a precaution, the switch should be unplugged in case of power failure. When power is resumed, the switch should be plugged back in.

Grounding the Switch

This section describes how to connect the DGS-1100 MP/MPP Series switch to ground. You must complete this procedure before powering your switch.

Required Tools and Equipment

- Ground screws (included in the accessory kit): One M4 x 8 mm (metric) pan-head screw
- Ground cable (not included in the accessory kit): The grounding cable should be sized according to local and national installation requirements. Depending on the power supply and system, a 12 to 6 AWG copper conductor is required for U.S installation. Commercially available 6 AWG wire is recommended. The length of the cable depends on the proximity of the switch to proper grounding facilities.
- A screwdriver (not included in the accessory kit)

Follow these steps to ground the switch:

Step 1: Verify that the switch is not connected to a power supply.

Step 2: Use the ground cable to place the #8 terminal lug ring on top of the ground-screw opening, as seen in the figure below.

Step 3: Insert the ground screw into the ground-screw opening.

Step 4: Using a screwdriver, tighten the ground screw to secure the ground cable to the switch.

Step 5: Attach the terminal lug ring at the other end of the grounding cable to an appropriate grounding stud or bolt on rack where the switch is installed.

Step 6: Verify if the connections at the ground connector on the switch and the rack are securely attached.

Figure 3-5 Ground cable, screw and #8 terminal lug rings

CAUTION: This equipment is to be connected only to PoE networks without routing to the outside plant.

4. Web-based Switch Configuration

Management Options

Connecting using the Web User Interface

Logging onto the Web User Interface

Smart Wizard

Web User Interface (Web UI)

Management Options

The switch provides multiple access platforms that can be used to configure, manage and monitor networking features available on the switch. Currently there are three management platforms available and they are described below.

Web-based Management Interface

After successfully installing the switch, the user can configure the switch, monitor the LED panel, and display statistics graphically using a Web browser, such as Microsoft® Internet Explorer, Opera Firefox, Safari, or Google Chrome.

SNMP-based Management

The switch can be managed with an SNMP-compatible console program. The switch supports SNMP version 1.0, and version 2c. The SNMP agent decodes the incoming SNMP messages and responds to requests with MIB objects stored in the database. The SNMP agent updates the MIB objects to generate statistics and counters.

D-Link Network Assistant

DNA (D-Link Network Assistant) included on the installation CD is a program for discovering DGS-1100 MP/MPP Series switches with the same L2 network segment connected to your PC. This tool can support windows 2000, XP, Vista, and Windows 7.

Connecting using the Web User Interface

Most software functions of the DGS-1100 MP/MPP Series switches can be managed, configured and monitored via the embedded web-based (HTML) interface. Manage the switch from remote stations anywhere on the network through a standard web browser. The web browser acts as a universal access tool and can communicate directly with the switch using the HTTP or HTTPS protocol.

You need the following equipment to begin the web configuration of your device:

- A PC with a RJ-45 Ethernet connection
- A standard Ethernet cable

Figure 4-1 Connecting to a DGS-1100 MP/MPP Series switch

Connect the Ethernet cable to any of the ports on the front panel of the switch and to the Ethernet port on the PC.

Logging onto the Web User Interface

To access the Web UI, simply open a web browser and enter the switch's default IP address into the address bar. Make sure that the IP address of the management PC is in the same subnet as the IP address of the switch you are trying to connect to.

NOTE: The default IP address of the switch is **10.90.90.90**, with a subnet mask of **255.0.0.0**.

NOTE: The default username is '**admin**' and password is '**admin**'.

After successfully connecting to the Web UI, the Smart Wizard will be launched.

Smart Wizard

The Smart Wizard is a configuration utility that is launched the first time the Web UI is accessed. It allows users to configure basic settings such as the switch mode, management IP and password. It can also be used to switch between Standard Mode and Surveillance Mode Web UI types.

Step 1 – Web Mode

The initial page allows the user to choose between Standard Mode and Surveillance Mode on the switch. This can be changed at any time by returning to the Smart Wizard.

For more information on the Surveillance Mode features of the switch, please refer to the Surveillance Mode Web UI Reference Guide.

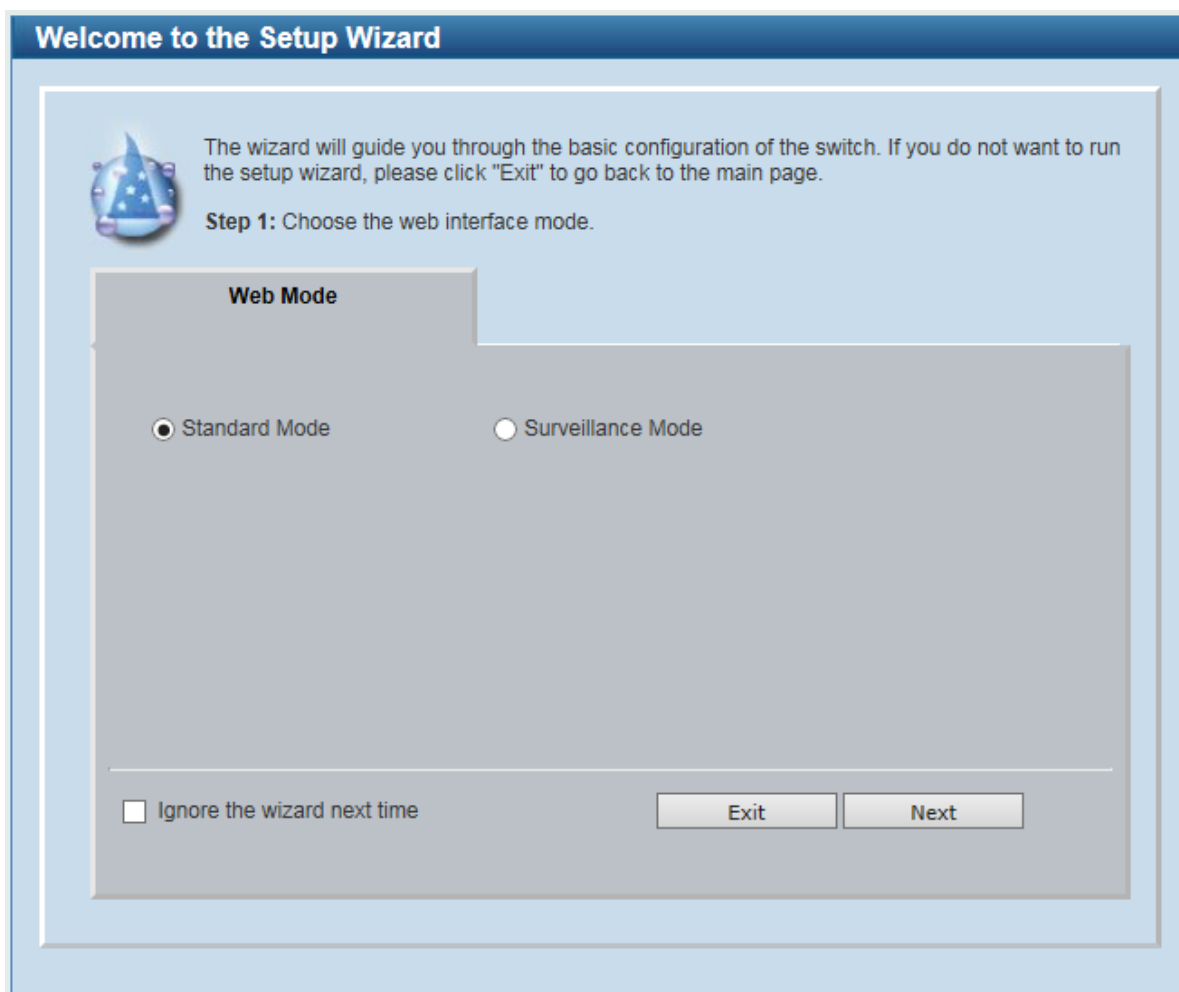

Figure 4-1 Web Mode window

The fields that can be configured are described below:

Parameter	Description
Web Mode	Select the Standard Mode option to continue the Smart Wizard in Standard Mode. Please refer to the Surveillance Mode Web UI Reference Guide for more information on Surveillance Mode.

Tick the **Ignore the wizard next time** option to skip the Smart Wizard on the next login.

Click the **Exit** button to discard the changes made, exit the Smart Wizard, and continue to the Web UI.

Click the **Next** button to accept the changes made and continue to the next step.

Step 2 – System IP Information

In this window, the user can configure the IP address assignment method, the static IP address, net mask and gateway address.

Welcome to the Setup Wizard

The switch will probe IP-Cameras every 30 seconds. If an IP-Camera is not in the same subnet as the switch, the IP-Camera will not be automatically discovered. You can set the switch to be a DHCP client (listening to a DHCP server for IP assignment).

Step 2: The wizard will help to complete settings for System IP address, Netmask, and Gateway.

System IP Information

Static DHCP

IP Address: 10 - 90 - 90 - 90

Netmask: 8 (255.0.0.0)

Gateway: 10 - 90 - 90 - 254

Ignore the wizard next time

Figure 4-2 System IP Information window

The fields that can be configured are described below:

Parameter	Description
Static	Select this option to manually configure and use IP address settings on this switch.
DHCP	Select this option to obtain IP address settings from a DHCP server.
IP Address	Enter the IP address of the switch here.
Net mask	Select the net mask option here.
Gateway	Enter the default gateway IP address here.

Tick the **Ignore the wizard next time** option to skip the Smart Wizard on the next login.

Click the **Exit** button to discard the changes made, exit the Smart Wizard, and continue to the Web UI.

Click the **Next** button to accept the changes made and continue to the next step.

Step 3 – Admin Password

In this window, the user can set the password used with the admin account.

The screenshot shows a web-based setup wizard window titled "Welcome to the Setup Wizard". The main content area is titled "Step 3: Set the password for admin access." and features a wizard icon. Below the title, there is a "Password" section with two text input fields: "Password" and "Confirm Password". At the bottom of the wizard, there is a checkbox labeled "Ignore the wizard next time" and three buttons: "Exit", "Back", and "Next".

Figure 4-3 Admin Password

Tick the **Ignore the wizard next time** option to skip the Smart Wizard on the next login.

Click the **Exit** button to discard the changes made, exit the Smart Wizard, and continue to the Web UI.

Click the **Next** button to accept the changes made and continue to the next step.

Step 4 – SNMP Settings

In this window, the user can enable or disable the SNMP function.

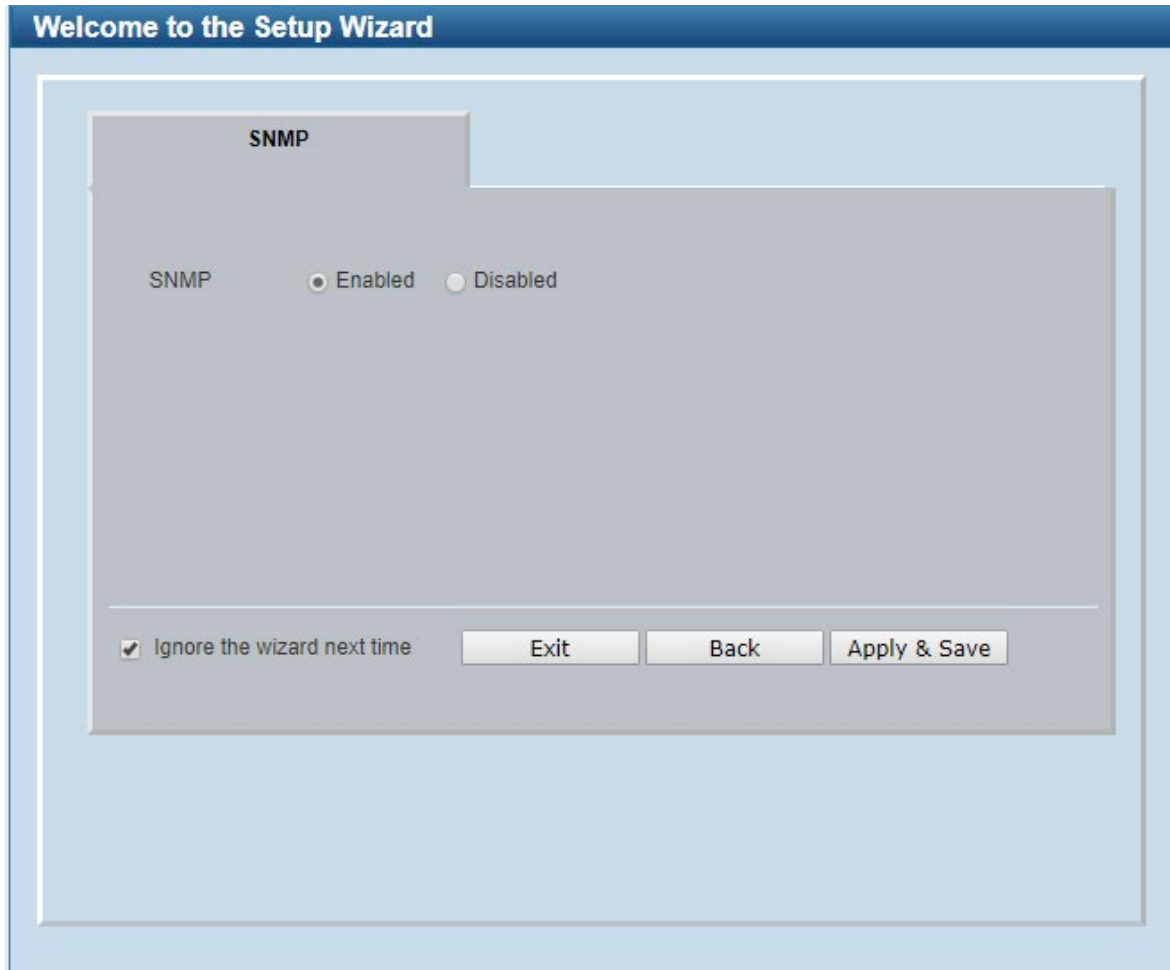

Figure 4-4 SNMP window

The fields that can be configured are described below:

Parameter	Description
SNMP	Select the Enabled option to enable the SNMP function. Select the Disabled option to disable the SNMP function.

Tick the **Ignore the wizard next time** option to skip the Smart Wizard on the next login.

Click the **Exit** button to discard the changes made, exit the Smart Wizard, and continue to the Web UI.

Click the **Apply & Save** button to accept the changes made, and then continue to the Web UI.

NOTE: Standard Mode and Surveillance Mode Web UIs share the same configuration files. Any features enabled in one interface will be made available in the other interface.

NOTE: Settings are saved between interface types. It is possible to switch interface types and re-run the Smart Wizard without losing settings saved in one version of the interface.

Web User Interface (Web UI)

By clicking the **Exit** button in the Smart Wizard, you will enter the Web-based Management interface.

Areas of the User Interface

The figure below shows the user interface. Two distinct areas divide the user interface, as described in the table.

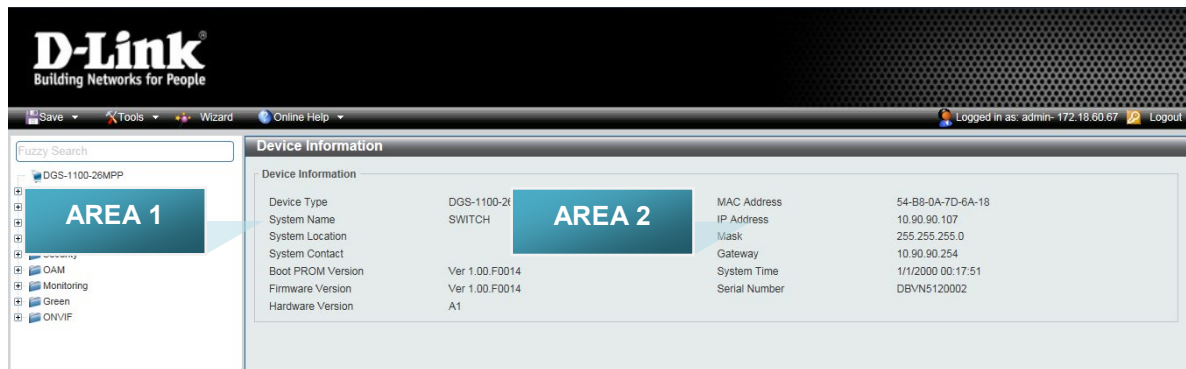

Figure 4-5 Main Web UI window

Area Number	Description
AREA 1	The navigation menu is displayed in this area. Click on the links and navigate the folder structure to display information on the main page.
AREA 2	This is the main page for displaying information and configuration options for the switch. The page displayed here is based on the selection in AREA 1 .

5. Device Information

Device information such as firmware version, MAC address and serial number are displayed in this window. It appears automatically when you log in to the switch. To return to the Device Information window after viewing other windows, click the model number of the switch at the top of the navigation menu.

Device Information			
Device Information			
Device Type	DGS-1100-26MP Gigabit Ethernet Switch	MAC Address	80-26-89-E6-1A-E1
System Name	D-Link	IP Address	10.90.90.90
System Location		Mask	255.0.0.0

System Information Settings

The user can enter a System Name, System Location, and System Contact to aid in defining the switch.

To view the following window, click **System > System Information Settings > System Information**, as shown below:

Figure 6-1 System Information window

The fields that can be configured are described below:

Parameter	Description
System Name	Enter a system name for the switch, if so desired. This name will identify it on the switch network.
System Location	Enter the location of the switch, if so desired.
System Contact	Enter a contact name for the switch, if so desired.

Click the **Apply** button to accept the changes made.

IPv4 Interface

This window is used to configure the IPv4 settings of the switch.

To view the following window, click **System > System Information Settings > IPv4 Interface**, as shown below:

Figure 6-2 Peripheral Settings window

The fields that can be configured are described below:

Parameter	Description
Get IP From	Select DHCP to automatically obtain an IP address. Select Static to manually configure the IP address settings. BOOTP allows the switch to get an IP configuration using the BOOTP protocol.
IP Address	If Static is selected, enter the IP address of the switch. If DHCP or BOOTP is selected, the automatically obtained IP address will be displayed.
Mask	If Static is selected, enter the IP address of the switch. If DHCP or BOOTP is selected, the automatically obtained network mask will be displayed.
Gateway	If Static is selected, enter the IP address of the switch. If DHCP or BOOTP is selected, the automatically obtained gateway will be displayed.
DHCP retry Time	If DHCP is selected, enter the number of times to retry obtaining an IP address.

Click the **Apply** button to accept the changes made.

IPv6 Interface

This window is used to configure the IPv6 settings of the switch.

To view the following window, click **System > System Information Settings > IPv6 Interface**, as shown below:

Figure 6-3 Peripheral Settings window

The fields that can be configured are described below:

Parameter	Description
IPv6 State	Select whether to Enable or Disable IPv6 functionality.
Static IPv6 Address	If enabled, enter the static IPv6 address of the switch.

Click the **Apply** button to accept the changes made.

Port Configuration

Port Settings

This window is used to view and configure the switch's port settings.

To view the following window, click **System > Port Configuration > Port Settings**, as shown below:

Figure 6-4 Port Settings window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
State	Select this option to enable or disable the physical port here.
MDIX	Select the Medium Dependent Interface Crossover (MDIX) option here. Options to choose from are Auto , Normal , and Cross . Auto - Select this option for auto-sensing of the optimal type of cabling. Normal - Select this option for normal cabling. If this option is selected, the port is in the MDIX mode and can be connected to a PC's NIC using a straight-through cable or a port (in the MDIX mode) on another switch through a cross-over cable. Cross - Select this option for cross cabling. If this option is selected, the port is in the MDI mode and can be connected to a port (in the MDIX mode) on another switch through a straight cable.
Flow Control	Select to either turn flow control On or Off here. Ports configured for full-duplex use 802.3x flow control, half-duplex ports use back-pressure flow control, and Auto ports use an automatic selection of the two.
Duplex	Select the duplex mode used here. Options to choose from are Auto , Half , and Full .
Speed	Select the port speed option here. This option will manually force the connected on the selected port to only connect at the speed specified here. Options to choose from are Auto , 10M , 100M . 1000M speed is only available when Auto is selected.
Description	Enter a 8 characters description for the corresponding port here.

Click the **Apply** button to accept the changes made.

Note: The SFP ports on the DGS-1100 MP/MPP series only support **Auto** for duplex and speed. Also, the fiber ports on the DGS-1100 MP/MPP series do not support MDIX.

Jumbo Frame

This window is used to view and configure the Jumbo Frame size and settings. The switch supports jumbo frames. Jumbo frames are Ethernet frames with more than 1,518 bytes of payload. The switch supports jumbo frames with a maximum frame size of up to 10240 bytes.

To view the following window, click **System > Port Configuration > Jumbo Frame**, as shown below:

Figure 6-5 Jumbo Frame window

The fields that can be configured are described below:

Parameter	Description
Jumbo Frame	Select whether to Enable or Disable support for Jumbo Frames on the switch.

Click the **Apply** button to accept the changes made.

PoE

The DGS-1100 MP/MPP Series switches support the IEEE 802.3af and 802.3at Power over Ethernet (PoE) standards. The DGS-1100 MPP Series also support the IEEE 802.3bt standard.

The ports and power ratings per switch are as follows:

Switch Model	Port Numbers	Power Rating
DGS-1100-10MP	1 - 8	30W
DGS-1100-10MPP	1 - 8 7 - 8	30W 90W
DGS-1100-26MP	1 - 24	30W
DGS-1100-26MPP	1 - 24 21 - 24	30W 90W

Power can be supplied at 48VDC to Powered Devices (PDs) over Category 5 or Category 3 UTP Ethernet cables. The switches follow the standard PSE (Power Sourcing Equipment) pinout *Alternative A*, where power is sent over pins 1, 2, 3 and 6.

The DGS-1100 MP/MPP Series switches include the following PoE features:

- Auto-discovery recognizes the connection of a PD (Powered Device) and automatically sends power to it.
- The Auto-disable feature occurs under two conditions: firstly, if the total power consumption exceeds the system power limit; and secondly, if the per port power consumption exceeds the per port power limit.
- Active circuit protection automatically disables the port if there is a short. Other ports will remain active.

Based on 802.3af/at PDs receive power according to the following classification:

Class	Maximum power used by PD
0	12.95W
1	3.84W
2	6.49W
3	12.95W
4	25.5W

PSE provides power according to the following classification:

Class	Max power supplied by PSE
0	16.2W
1	4.2W
2	7.4W
3	16.2W
4	31.6W

PoE System

This window is used to configure the PoE system, and display the detailed power information and PoE Trap parameters for PoE modules.

To view the following window, click **System > PoE > PoE System**, as shown below:

The PoE System configuration window contains the following elements:

- Usage Threshold (1-99):** A text input field containing the value '99' followed by a '%' symbol.
- Trap State:** A dropdown menu currently set to 'Disabled'.
- Apply:** A button to save the configuration.
- Summary Table:** A table with four columns: Power Budget (W), Delivered (W), Usage Threshold (%), and Trap State.

Figure 6-6 PoE System window

The fields that can be configured are described below:

Parameter	Description
Usage Threshold	Enter the usage threshold to generate a log and send the corresponding standard notification.
Trap State	Select this option to enable or disable the sending of PoE notifications.

Click the **Apply** button to accept the changes made.

PoE Status

This window displays the PoE status of each port.

To view the following window, click **System > PoE > PoE Status**, as shown below:

The PoE Status window displays a table with the following columns: Port, State, Class, Max (W), and Used (W). Below the table is a 'Note' section with a 'Faulty Code' list.

Port	State	Class	Max (W)	Used (W)
eth1	Searching	N/A	0.0	0.0
eth2	Searching	N/A	0.0	0.0
eth3	Searching	N/A	0.0	0.0
eth4	Searching	N/A	0.0	0.0
eth5	Searching	N/A	0.0	0.0
eth6	Searching	N/A	0.0	0.0
eth7	Searching	N/A	0.0	0.0
eth8	Searching	N/A	0.0	0.0
eth9	Searching	N/A	0.0	0.0
eth10	Searching	N/A	0.0	0.0
eth11	Searching	N/A	0.0	0.0
eth12	Searching	N/A	0.0	0.0

Note:
Faulty Code:
 [1] MPS (Maintain Power Signature) Absent
 [2] PD short
 [3] Overload
 [4] Power Denied
 [5] Thermal Shutdown
 [6] Startup Failure
 [7] Classification Failure

Figure 6-7 PoE Status window

Note: For the PoE Status table, if the classification was shown as “Legacy PD”, it will be classified to non-AF PD or Legacy PD.

PoE Configuration

This window is used to configure the PoE port.

To view the following window, click **System > PoE > PoE Configuration**, as shown below:

Figure 6-8 PoE Configuration window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Priority	Select the priority for provisioning power to the port. Options to choose from are Critical , High and Low .
State	Select this option to enable or disable the PoE functionality. Options to choose from are Disabled or Enabled .
4-Pair State	This is used to enable 60W PoE or 90W PoE by utilizing all 4 pairs in a standard Ethernet cable. It can also be used to disable this functionality. Options to choose from are Disabled , 60W Enabled and 90W Enabled .
Legacy	Use this to enable or disable PoE support for non-802.3af devices. These will show up in the Legacy column as Disabled or Enabled, depending on which option is chosen. Options to choose from are Disabled or Enabled .
Power Limit	Select the power management mode for the PoE ports. Options to choose from are Auto , Class 1 , Class 2 , Class 3 , and Class 4 .
Max Wattage	When selecting Auto in the Mode drop-down list, this option appears. Tick the check box and enter the maximum wattage of power that can be provisioned to the auto-detected PD. If the value is not entered, the class of the PD automatically determines the maximum wattage which can be provisioned. The valid range for maximum wattage is between 1000 mW and 30000 mW.
Time Profile	Select the Time Profile from the drop down list. Note: The Time Profile drop down menu will only have available options if a time profile has been created.

Click the **Delete Time Range** button to clear the setting in the corresponding Time Range field.

Click the **Apply** button to accept the changes made.

Note: The **Max Wattage** option will only be available if the check box next to the input field is enabled. When enabled, the Power Limit drop down menu will not be available.

Note: If the switch failed to supply power to the IEEE 802.3at PD (Powered Device),

1. Check if the PD connected to the port supports the IEEE 802.3at standard.

2. Manually configure the corresponding port's power limit value to 30 Watts.

CAUTION: Before connecting the PD, make sure it supports IEEE802.3bt, as otherwise it will become damaged.

System Log

System Log Settings

This window is used to view and configure the system's log settings.

To view the following window, click **System > System Log > System Log Settings**, as shown below:

Figure 6-9 System Log Settings window

The fields that can be configured for **Global State** are described below:

Parameter	Description
System Log	Select this option to enable or disable the System Log functionality.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Buffer Log Settings** are described below:

Parameter	Description
Buffer Log State	Select whether the enable or disable the buffer log's global state here. Options to choose from are Enable , Disabled .

Click the **Apply** button to accept the changes made.

System Log Server Settings

This window is used to view and configure system log's server settings.

To view the following window, click **System > System Log > System Log Server Settings**, as shown below:

Figure 6-10 System Log Server Settings window

The fields that can be configured are described below:

Parameter	Description
Host IPv4 Address	Enter the system log server's IPv4 address here.
UDP Port	Enter the system log server's UDP port number here. This value must be between 1024 and 65535. By default, this value is 514.
Facility	Specifies an application from which system logs are sent to the remote server. Only one facility can be assigned to a single server. If a second facility level is assigned, the first facility is overwritten. There are up to eight facilities can be assigned (Local 0 to Local 7).
Severity	Select the severity value of the type of information that will be logged. Options to choose from are Warning , informational , and All The possible levels are: Warning - The lowest level of a device warning. The device is functioning, but an operational problem has occurred. Informational - Provides device information. All - Displays all levels of system logs.

Click the **Apply** button to accept the changes made.

System Log

This window is used to view and clear the system log.

To view the following window, click **System > System Log > System Log**, as shown below:

The screenshot shows the 'System Log' window with a 'Clear' button in the top right corner. Below the button is a table with the following data:

Index	Time	Level	Log Description
1	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/1 is set to enabled
2	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/2 is set to enabled
3	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/3 is set to enabled
4	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/4 is set to enabled
5	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/5 is set to enabled
6	Jan 01 2000 00:01:31	7	LINEPROTO-7-INFO: GigabitEthernet0/6 is set to enabled

Figure 6-11 System Log window

Click the **Clear Log** button to clear the system log entries displayed in the table.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

Time

The Simple Network Time Protocol (SNTP) is a protocol for synchronizing computer clocks through the Internet. It provides comprehensive mechanisms to access national time and frequency dissemination services, organize the SNTP subnet of servers and clients, and adjust the system clock in each participant.

Clock Settings

This window is used to configure the time settings for the switch.

To view the following window, click **System > Time > Clock Settings**, as shown below:

Figure 6-12 Clock Settings window

The fields that can be configured are described below:

Parameter	Description
Time (HH:MM:SS)	Enter the current time in hours, minutes, and seconds.
Date (DD / MM / YYYY)	Enter the current day, month, and year to update the system clock.

Click the **Apply** button to accept the changes made.

Time Zone Settings

This window is used to configure time zones and Daylight Savings Time settings for SNTP.

To view the following window, click **System > Time > Time Zone Settings**, as shown below:

Figure 6-13 Time Zone Settings window

The fields that can be configured are described below:

Parameter	Description
Summer Time State	Select the summer time setting. Options to choose from are Disabled , and Date Setting . Disabled - Select to disable the summer time setting. Date Setting - Select to configure the summer time that should start and end on the specified date.
Time Zone	Select to specify your local time zone's offset from Coordinated Universal Time (UTC).

The fields that can be configured for **Date Setting** are described below:

Parameter	Description
From: Date of the Month	Select date of the month that summer time will start.
From: Month	Select the month that summer time will start.
From: Year	Enter the year that the summer time will start.
From: Time (HH:MM)	Select the time of the day that summer time will start.
To: Date of the Month	Select date of the month that summer time will end.
To: Month	Select the month that summer time will end.
To: Year	Enter the year that the summer time will end.
To: Time (HH:MM)	Select the time of the day that summer time will end.
Offset	Enter the number of minutes to add during summer time. The default value is 60. The range of this offset is 30, 60, 90 and 120.

Click the **Apply** button to accept the changes made.

SNTP Settings

This window is used to configure the time settings for the switch.

To view the following window, click **System > Time > SNTP Settings**, as shown below:

Figure 6-14 SNTP Settings window

The fields that can be configured for **SNTP Global Settings** are described below:

Parameter	Description
Current Time Source	This will indicate the current time source and will change from System Clock to SNTP when SNTP is configured and functioning.
SNTP State	Select this option to enable or disable SNTP.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **SNTP Server Setting** are described below:

Parameter	Description
IPv4 Address	Enter the IP address of the SNTP server which provides the clock synchronization.

Click the **Apply** button to add the SNTP server.

Time Profile

This window is used to view and configure the time range settings. The maximum number of time profiles supported by the switch is 4.

To view the following window, click **System > Time Profile**, as shown below:

Figure 6-15 Time Profile window

The fields that can be configured are described below:

Parameter	Description
Range Name	Enter the name of the time range. This name can be up to 8 characters long.
From Week / To Week	Select the starting and ending days of the week that will be used for this time range. Tick the Daily option to use this time range for every day of the week. Tick the End Week Day option to use this time range from the starting day of the week until the end of the week, which is Sunday.
From Time / To Time	Select the starting and ending time of the day that will be used for this time range. The first drop-down menu selects the hour and the second drop-down menu selects the minute.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

7. Management

User Account Settings

SNMP

HTTP/HTTPS

D-Link Discovery Protocol

User Account Settings

This window is used to configure the user accounts. The active user account sessions can be viewed.

There are several configuration options available in the Web User Interface (Web UI). The set of configuration options available to the user depends on the account's **Privilege Level**.

NOTE: By default, the admin account is created on the switch.

To view the following window, click **Management > User Account Settings**, as shown below:

User Accounts Settings			
User Accounts Settings			
User Name	admin	Password	20 chars
Apply			
Total Entries: 2			
User Name	Privilege	Password	Action
admin	15	*****	Delete
user	1	*****	Delete

Figure 7-1 User Account Settings window

The fields that can be configured are described below:

Parameter	Description
User Name	Select the user account name here.
Password	Enter the password for the account here.

Click the **Apply** button to accept the changes made.

Note: Only one user can be logged into the switch at any time.

SNMP

Simple Network Management Protocol (SNMP) is an OSI Layer 7 (Application Layer) designed specifically for managing and monitoring network devices. SNMP enables network management stations to read and modify the settings of gateways, routers, switches, and other network devices. Use SNMP to configure system features for proper operation, monitor performance and detect potential problems in the switch, switch group or network.

Managed devices that support SNMP include software (referred to as an agent), which runs locally on the device. A defined set of variables (managed objects) is maintained by the SNMP agent and used to manage the device. These objects are defined in a Management Information Base (MIB), which provides a standard presentation of the information controlled by the on-board SNMP agent. SNMP defines both the format of the MIB specifications and the protocol used to access this information over the network.

The switch supports the SNMP versions 1, and 2c. The two versions of SNMP vary in the level of security provided between the management station and the network device.

In SNMP v.1 and v2c, user authentication is accomplished using 'community string', which function like passwords. The remote user SNMP application and the switch SNMP must use the same community string. SNMP packets from any station that has not been authenticated are ignored (dropped).

Traps

Traps are messages that alert network personnel of events that occur on the switch. The events can be as serious as a reboot (someone accidentally turned OFF the switch), or less serious like a port status change. The switch generates traps and sends them to the trap recipient (or network manager). Typical traps include trap messages for Authentication Failure, and Topology Change.

MIBs

The switch in the Management Information Base (MIB) stores management and counter information. The switch uses the standard MIB-II Management Information Base module. Consequently, values for MIB objects can be retrieved from any SNMP-based network management software. In addition to the standard MIB-II, the switch also supports its own proprietary enterprise MIB as an extended Management Information Base. Specifying the MIB Object Identifier may also retrieve the proprietary MIB. MIB values can be either read-only or read-write.

The switch supports the Simple Network Management Protocol (SNMP) versions 1, and 2c. The administrator can specify the SNMP version used to monitor and control the switch.

SNMP settings are configured using the menus located on the SNMP folder of the Web manager. Workstations on the network that are allowed SNMP privileged access to the switch can be restricted with the Management Station IP Address menu.

SNMP Global Settings

This window is used to configure the SNMP global settings and trap settings.

To view the following window, click **Management > SNMP > SNMP Global Settings**, as shown below:

Figure 7-2 SNMP Global Settings window

The fields that can be configured for **SNMP Global Settings** are described below:

Parameter	Description
SNMP Global State	Select this option to enable or disable the SNMP feature.

The fields that can be configured for **Trap Settings** are described below:

Parameter	Description
Trap Global State	Select this option to enable or disable the sending of all or specific SNMP notifications.
SNMP Authentication Trap	Tick this option to control the sending of SNMP authentication failure notifications.
Port Link Up	Tick this option to control the sending of port link up notifications.
Port Link Down	Tick this option to control the sending of port link down notifications.
PD Alive	Tick this option to control the sending of PD offline notifications.
Coldstart	Tick this option to control the sending of SNMP Cold Start notifications.
Warmstart	Tick this option to control the sending of SNMP Warm Start notifications.
STP Trap	Tick this option to control the sending of STP state notifications.

Click the **Apply** button to accept the changes made.

SNMP Community Table Settings

This window is used to create an SNMP community string to define the relationship between the SNMP manager and an agent. The community string acts like a password to permit access to the

agent on the switch. One or more of the following characteristics can be associated with the community string:

- Read/write or read-only level permission for the MIB objects accessible to the SNMP community.

To view the following window, click **Management > SNMP > SNMP Community Table Settings**, as shown below:

Figure 7-3 SNMP Community Table Settings window

The fields that can be configured are described below:

Parameter	Description
Access Right	Select the access right here. Options to choose from are Read Only , and Read Write . Read Only - SNMP community members using the community string created can only read the contents of the MIBs on the switch. Read Write -SNMP community members using the community string created can read from, and write to the contents of the MIBs on the switch.
Community Name	Enter an alphanumeric string of up to 16 characters that is used to identify members of an SNMP community. This string is used like a password to give remote SNMP managers access to MIB objects in the switch's SNMP agent.

Click the **Apply** button to accept the changes made.

SNMP Host Table Settings

This window is used to configure and display the recipient of the SNMP notification.

To view the following window, click **Management > SNMP > SNMP Host Table Settings**, as shown below:

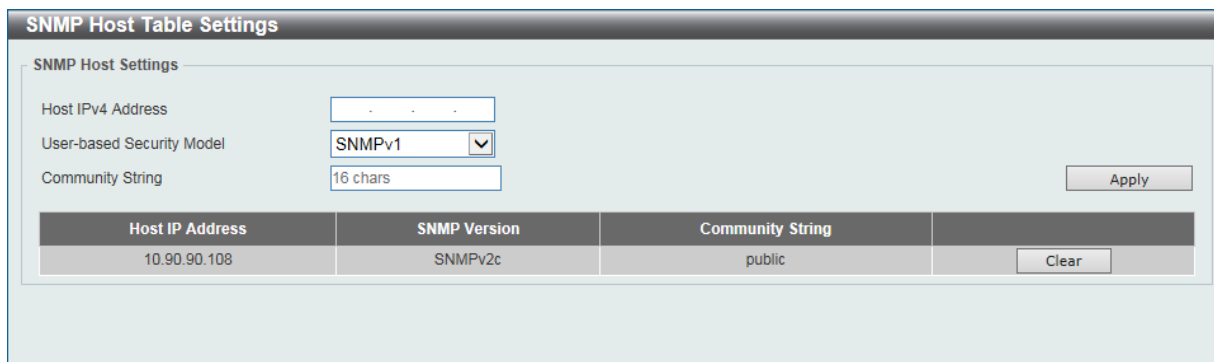

Figure 7-4 SNMP Host Table Settings

The fields that can be configured are described below:

Parameter	Description
Host IPv4 Address	Enter the IPv4 address of the SNMP notification host.
User-based Security Model	Select the security model here. Options to choose from are SNMPv1 , and SNMPv2c . SNMPv1 - Select to allow the group user to use the SNMPv1 security model. SNMPv2c -Select to allow the group user to use the SNMPv2c security model.
Community String	Enter the community string to be sent with the notification packet.

Click the **Apply** button to accept the changes made.

Click the **Clear** button to remove SNMP Host.

HTTP/HTTPS

This window is used to configure Web settings on the switch.

To view the following window, click **Management > HTTP/HTTPS**, as shown below:

Figure 7-5 HTTP/HTTPS window

The fields that can be configured for **HTTP/HTTPS Settings** are described below:

Parameter	Description
Web Session	Select this option to enable the configuration through HTTP or HTTPS. Note: When switching from HTTP to HTTPS mode, the switch will take about 30 seconds to initialize the secured HTTP environment.
Web Session Timeout	Enter a value for the amount of time in seconds before the web session expires.

Click the **Apply** button to accept the changes made.

Note: If the switch is in HTTPS mode, the firmware or configuration cannot be upgraded using regular HTTP.

D-Link Discovery Protocol

This window is used to configure and display D-Link Discovery Protocol (DDP).

To view the following window, click **Management > D-Link Discovery Protocol**, as shown below:

D-Link Discovery Protocol

D-Link Discovery Protocol State Enabled Disabled

Report Timer Never sec Apply

Figure 7-6 D-Link Discovery Protocol window

The fields that can be configured for **D-Link Discovery Protocol** are described below:

Parameter	Description
D-Link Discovery Protocol State	Select this option to enable or disable DDP global state.
Report Timer	Select the interval in seconds between two consecutive DDP report messages. Options to choose from are 30, 60, 90, 120, and Never .

Click the **Apply** button to accept the changes made.

8. Layer 2 Features

FDB
VLAN
Spanning Tree
ERPS
Loopback Detection
Link Aggregation
L2 Multicast Control
LLDP

FDB

Static FDB

Unicast Static FDB

This window is used to view and configure the static unicast forwarding settings on the switch.

To view the following window, click **L2 Features > FDB > Static FDB > Unicast Static FDB**, as shown below:

Figure 8-1 Unicast Static FDB window

The fields that can be configured are described below:

Parameter	Description
Port	Allows the selection of the port number on which the MAC address entered resides.
VID	Enter the VLAN ID on which the associated unicast MAC address resides.
MAC Address	Enter the MAC address to which packets will be statically forwarded or dropped. This must be a unicast MAC address.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to delete all the entries found in the display table.

Click the **Delete** button to remove the specified entry.

Multicast Static FDB

This window is used to view and configure the multicast static FDB settings. To view the following window, click **L2 Features > FDB > Static FDB > Multicast Static FDB**, as shown below:

Figure 8-2 Multicast Static FDB window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
VID	Enter the VLAN ID of the VLAN the corresponding MAC address belongs to.
MAC Address	Enter the static destination MAC address of the multicast packets. This must be a multicast MAC address. The format of the destination MAC address is 01-XX-XX-XX-XX-XX.

Click the **Apply** button to accept the changes made.

Click the **Delete All** button to remove all the entries.

Click the **Delete** button to remove the specific entry.

MAC Address Table Settings

This window is used to view and configure the MAC address table's global settings.

To view the following window, click **L2 Features > FDB > MAC Address Table Settings**, as shown below:

Figure 8-3 MAC Address Table Settings (Global Settings) window

The fields that can be configured are described below:

Parameter	Description
Aging Time	Enter the MAC address table's aging time value here. This value must be between 10 and 1000000 seconds. Entering 0 will disable MAC address aging. By default, this value is 300 seconds.

Click the **Apply** button to accept the changes made.

After clicking the **MAC Address Learning** tab, at the top of the page, the following page will be available.

Port	State
eth1	Enable
eth2	Enable
eth3	Enable
eth4	Enable

eth20	Enable
eth21	Enable
eth22	Enable

Figure 8-4 MAC Address Table Settings (MAC Address Learning) window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the range of ports that will be used for this configuration here.
State	Select to enable or disable the MAC address learning function on the ports specified here.

Click the **Apply** button to accept the changes made.

MAC Address Table

This window is used to view the entries listed in the MAC address table.

To view the following window, click **L2 Features > FDB > MAC Address Table**, as shown below:

VID	MAC Address	Type	Port
-----	-------------	------	------

Figure 8-5 MAC Address Table window

Click the **Clear All** button to clear all dynamic MAC addresses.

VLAN

802.1Q VLAN

This window is used to view and configure the VLAN settings on this switch.

To view the following window, click **L2 Features > VLAN > 802.1Q VLAN**, as shown below:

VID	VLAN Name	Tagged Member Ports	Untagged Member Ports	VLAN Type
-----	-----------	---------------------	-----------------------	-----------

Figure 8-6 802.1Q VLAN window

The fields that can be configured for **802.1Q VLAN** are described below:

Parameter	Description
VID List	Enter the VLAN ID list that will be created here.

Click the **Apply** button to accept the changes made.

Click the **Edit** button to re-configure the specific entry.

Click the **Delete** button to remove the specific entry.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

Port-based VLAN

This window is used to configure the asymmetric VLAN function.

To view the following window, click **L2 Features > VLAN > Port-based VLAN**, as shown below:

Figure 8-7 Asymmetric VLAN window

The fields that can be configured are described below:

Parameter	Description
VLAN State	Select this option to enable or disable the Port-based VLAN function.

Click the **Apply** button to accept the changes made.

Management VLAN

This window is used to configure the asymmetric VLAN function.

To view the following window, click **L2 Features > VLAN > Management VLAN**, as shown below:

Figure 8-8 Asymmetric VLAN window

The fields that can be configured are described below:

Parameter	Description
Management VLAN State	Select this option to enable or disable the Management VLAN function.
VID	VLAN VID is a unique number (between 1 and 4094) that identifies a particular VLAN.

Click the **Apply** button to accept the changes made.

Asymmetric VLAN

This window is used to configure the asymmetric VLAN function.

To view the following window, click **L2 Features > VLAN > Asymmetric VLAN**, as shown below:

Figure 8-9 Asymmetric VLAN window

The fields that can be configured are described below:

Parameter	Description
Asymmetric VLAN State	Select this option to enable or disable the asymmetric VLAN function

Click the **Apply** button to accept the changes made.

VLAN Interface

This window is used to view and configure VLAN interface settings.

To view the following window, click **L2 Features > VLAN > VLAN Interface**, as shown below:

Figure 8-10 VLAN Interface window

Click the **View Detail** button to view more detailed information about the VLAN on the specific interface.

Click the **Edit** button to re-configure the specific entry.

After clicking the **VLAN Detail** button, the following page will appear.

VLAN Interface Information	
Port	eth1
VLAN Mode	Hybrid
Native VLAN	1
Hybrid Untagged VLAN	1,
Hybrid Tagged VLAN	-
Ingress Checking	Enabled
Acceptable Frame Type	Admit All

<<Back

Figure 8-11 VLAN Interface Information window

More detailed information about the VLAN of the specific interface is displayed.

Click the **Back** button to return to the previous window.

After click the **Edit** button, the following window will appear. This is a dynamic window that will change when a different **VLAN Mode** was selected. When **Access** was selected as the **VLAN Mode**, the following page will appear.

Configure VLAN Interface			
Configure VLAN Interface			
Port	eth1	<input type="checkbox"/> Clone	
VLAN Mode	Access	From Port	To Port
Acceptable Frame	Untagged Only	eth1	eth1
Ingress Checking	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled		
VID(1-4094)			

<<Back Apply

Figure 8-12 Configure VLAN Interface- Access window

The fields that can be configured are described below:

Parameter	Description
VLAN Mode	Select the VLAN mode option here. Options to choose from are Access , Hybrid , and Trunk .
Acceptable Frame	Select the acceptable frame behavior option here. Options to choose from are Tagged Only , Untagged Only , and Admit All .
Ingress Checking	Select this option to enable or disable the ingress checking function.
VID	Enter the VLAN ID used for this configuration here. This value must be between 1 and 4094.
From Port / To Port	Select the appropriate port range used for the Clone configuration here.

Click the **Apply** button to accept the changes made.

Click the **Back** button to return to the previous window.

When **Hybrid** was selected as the **VLAN Mode**, the following page will appear.

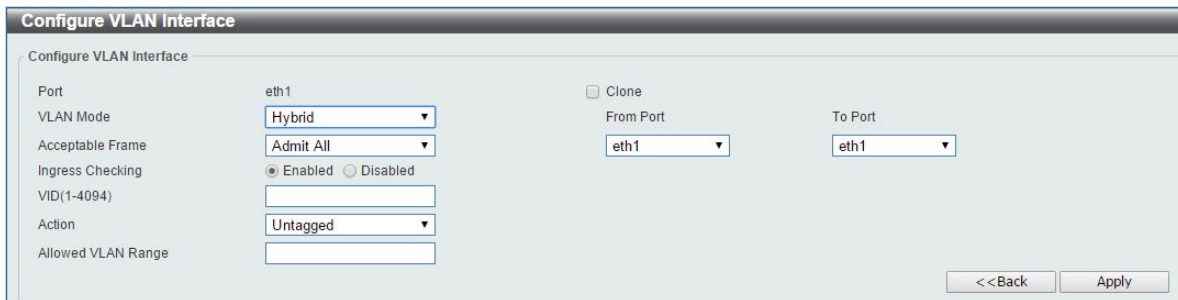

Figure 8-13 Configure VLAN Interface - Hybrid window

The fields that can be configured are described below:

Parameter	Description
VLAN Mode	Select the VLAN mode option here. Options to choose from are Access , Hybrid , and Trunk .
Acceptable Frame	Select the acceptable frame behavior option here. Options to choose from are Tagged Only , Untagged Only , and Admit All .
Ingress Checking	Select the check box to enable or disable the ingress checking function.
VID	Enter the VLAN ID used for this configuration here. This value must be between 1 and 4094.
Action	Select the action that will be taken here. Options to choose from are Remove , Tagged , and Untagged .
Allowed VLAN Range	Enter the allowed VLAN range information here.
From Port / To Port	Select the appropriate port range used for the Clone configuration here.

Click the **Apply** button to accept the changes made.

Click the **Back** button to return to the previous window.

When **Trunk** is selected as the **VLAN Mode**, the following page will appear.

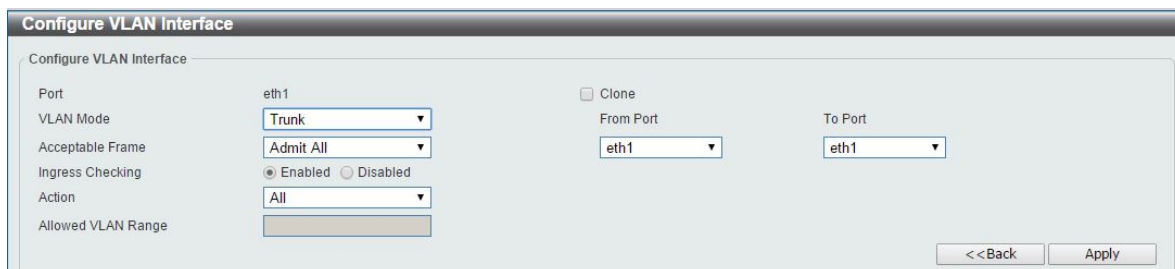

Figure 8-14 Configure VLAN Interface - Trunk window

The fields that can be configured are described below:

Parameter	Description
VLAN Mode	Select the VLAN mode option here. Options to choose from are Access , Hybrid , and Trunk .
Acceptable Frame	Select the acceptable frame behavior option here. Options to choose from are Tagged Only , Untagged Only , and Admit

	All.
Ingress Checking	After selecting Trunk as the VLAN Mode the following parameter will be available. Select to enable or disable the ingress checking function.
Action	Select the action that will be taken here. Options to choose from are Remove , Tagged , and Untagged .
Allowed VLAN Range	Enter the allowed VLAN range information here.
From Port / To Port	Select the appropriate port range used for the Clone configuration here.

Click the **Apply** button to accept the changes made.

Click the **Back** button to return to the previous window.

Auto Surveillance VLAN

Auto Surveillance Properties

This window is used to configure the auto surveillance VLAN global settings and display the ports surveillance VLAN information.

To view the following window, click **L2 Features > VLAN > Auto Surveillance VLAN > Auto Surveillance Properties**, as shown below:

Figure 8-15 Auto Surveillance Properties window

The fields that can be configured for **Global Settings** are described below:

Parameter	Description
Surveillance VLAN	Select this option to enable or disable the surveillance VLAN state
Surveillance VLAN ID	Enter the surveillance VLAN ID. The range is from 2 to 4094.
Surveillance VLAN CoS	Select the priority of the surveillance VLAN from 0 to 7.
Aging Time	Enter the aging time of surveillance VLAN. The range is from 1 to 65535 minutes. The default value is 720 minutes. The aging time is used to remove a port from surveillance VLAN if the port is an automatic surveillance VLAN member. When the last surveillance device stops sending traffic and the MAC address of this surveillance device is aged out, the surveillance VLAN aging timer will be started. The port will be removed from the surveillance VLAN after expiration of surveillance VLAN aging timer. If the surveillance traffic resumes during the aging time, the aging timer will be reset and stop.

Click the **Apply** button to accept the changes made.

MAC Settings and Surveillance Device

This window is used to configure the user-defined surveillance device OUI and display the surveillance VLAN information.

To view the following window, click **L2 Features > VLAN > Auto Surveillance VLAN > MAC Settings and Surveillance Device**, as shown below:

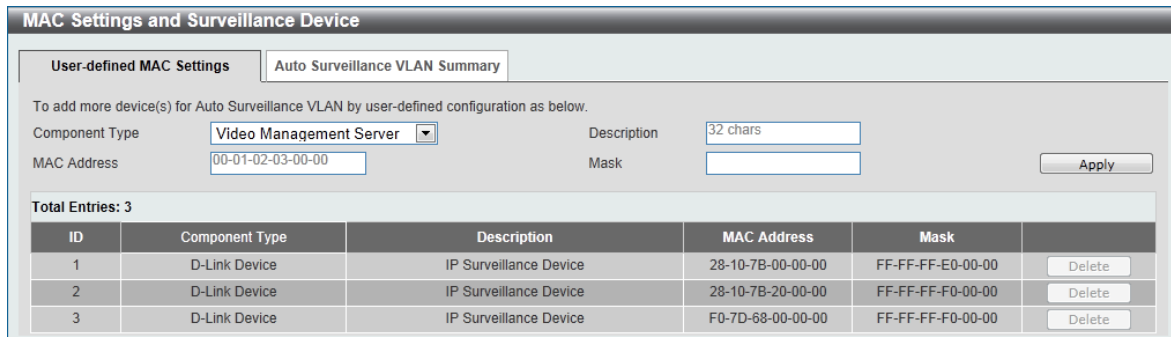

Figure 8-16 User -defined MAC Settings window

The fields that can be configured are described below:

Parameter	Description
Component Type	Select the surveillance component type. Options to choose from are Video Management Server , VMS Client/Remote Viewer , Video Encoder , Network Storage , and Other IP Surveillance Device .
Description	Enter the description for the user-defined OUI with a maximum of 8 characters.
MAC Address	Enter the OUI MAC address.
Mask	Enter the OUI MAC address matching bitmask.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

After clicking the **Auto Surveillance VLAN Summary** tab, the following page will appear.

Figure 8-17 Auto Surveillance VLAN Summary window

Voice VLAN

Voice VLAN Global

Voice VLAN is a VLAN used to carry voice traffic from IP phone. Because the sound quality of an IP phone call will be deteriorated if the data is unevenly sent, the quality of service (QoS) for voice traffic shall be configured to ensure the transmission priority of voice packet is higher than normal traffic.

The switches determine whether a received packet is a voice packet by checking its source MAC address. If the source MAC addresses of packets comply with the organizationally unique identifier (OUI) addresses configured by the system, the packets are determined as voice packets and transmitted in voice VLAN.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN Global**, as show below:

Figure 8-18 Voice VLAN Global window

The fields that can be configured are described below:

Parameter	Description
Voice VLAN State	Select this option to enable or disable the voice VLAN.
Voice VLAN ID	Enter the voice VLAN ID. The value is range from 2 to 4094.
Voice VLAN CoS	Select the priority of the voice VLAN from 0 to 7.
Aging Time	Enter the aging time of surveillance VLAN. The range is from 1 to 65535 minutes. The default value is 720 minutes. The aging time is used to remove a port from voice VLAN if the port is an automatic VLAN member. When the last voice device stops sending traffic and the MAC address of this voice device is aged out, the voice VLAN aging timer will be started. The port will be removed from the voice VLAN after expiration of voice VLAN aging timer. If the voice traffic resumes during the aging time, the aging timer will be reset and stop.

Click the **Apply** button to accept the changes made for each individual section.

Voice VLAN Port

This window is used to configure the user-defined voice traffic's port.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN OUI**, as show below:

Port	State	Mode
eth1	Disabled	Manual
eth2	Disabled	Manual
eth3	Disabled	Manual
eth4	Disabled	Manual
eth5	Disabled	Manual
eth6	Disabled	Manual
eth7	Disabled	Manual
eth8	Disabled	Manual
eth9	Disabled	Manual
eth10	Disabled	Manual

Figure 8-19 Voice VLAN Port window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the range of ports that will be used for this configuration here.
State	Select this option to enable or disable the Voice VLAN state of the port.
Mode	Choose the Voice VLAN mode for the port. This can be Auto untagged , Auto Tagged , or Manually configured.

Click the **Apply** button to accept the changes made.

Voice VLAN OUI

This window is used to configure the user-defined voice traffic's OUI. The OUI is used to identify the voice traffic. There are a number of pre-defined OUIs. The user can further define the user-defined OUIs if needed. The user-defined OUI cannot be the same as the pre-defined OUI.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN OUI**, as show below:

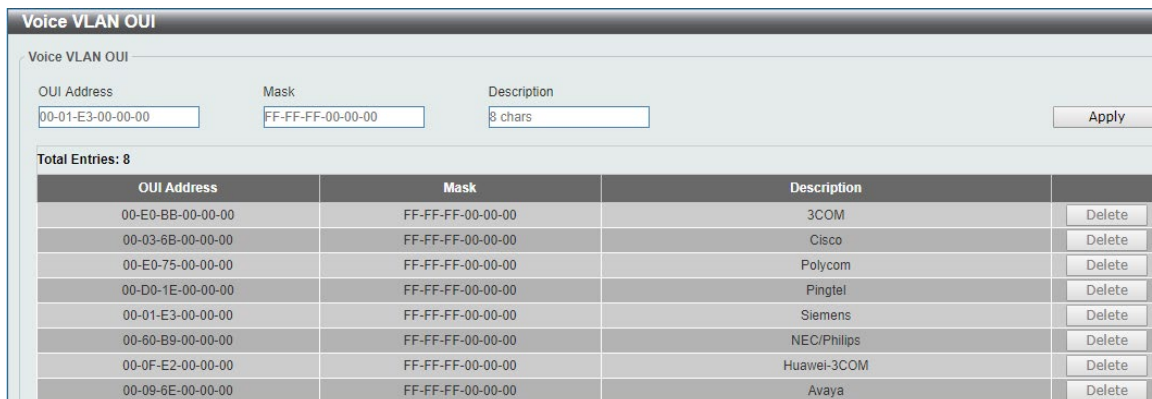

Figure 8-20 Voice VLAN OUI window

The fields that can be configured are described below:

Parameter	Description
OUI Address	Enter the OUI MAC address.
Mask	Enter the OUI MAC address matching bitmask.
Description	Enter the description for the user-defined OUI with a maximum of 8 characters.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

Voice VLAN Device

This window is used to show voice devices that are connected to the ports. The start time is the time when the device is detected on this port, the activate time is the latest time saw the device sending the traffic.

To view the following window, click **L2 Features > VLAN > Voice VLAN > Voice VLAN Device**, as show below:

Figure 8-21 Voice VLAN Device window

Spanning Tree

This switch supports two versions of the Spanning Tree Protocol: 802.1D-1998 STP, 802.1D-2004 Rapid STP. 802.1D-1998 STP will be familiar to most networking professionals. However, since 802.1D-2004 RSTP has been recently introduced to DGS-1100 MP/MPP switches, a brief introduction to the technology is provided below followed by a description of how to set up 802.1D-1998 STP, 802.1D-2004 RSTP.

802.1D-2004 Rapid Spanning Tree

Rapid Spanning Tree Protocol (RSTP) as defined by the IEEE 802.1D-2004 specification and a version compatible with the IEEE 802.1D-1998 STP. RSTP can operate with legacy equipment implementing IEEE 802.1D-1998; however the advantages of using RSTP will be lost.

The IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP) evolved from the 802.1D-1998 STP standard. RSTP was developed in order to overcome some limitations of STP that impede the function of some recent switching innovations, in particular, certain Layer 3 functions that are increasingly handled by Ethernet switches. The basic function and much of the terminology is the same as STP. Most of the settings configured for STP are also used for RSTP. This section introduces some new Spanning Tree concepts and illustrates the main differences between the two protocols.

Edge Port

The edge port is a configurable designation used for a port that is directly connected to a segment where a loop cannot be created. An example would be a port connected directly to a single workstation. Ports that are designated as edge ports transition to a forwarding state immediately without going through the listening and learning states. An edge port loses its status if it receives a BPDU packet, immediately becoming a normal spanning tree port.

Note: If Spanning Tree protocol is used, loopback detection will not be available. If Loopback Detection is enabled, the Spanning Tree protocol will not be available.

STP Global Settings

This window is used to view and configure the STP global settings.

To view the following window, click **L2 Features > Spanning Tree > STP Global Settings**, as shown below:

Figure 8-22 STP Global Settings window

The field that can be configured for **Spanning Tree State** is described below:

Parameter	Description
Spanning Tree State	Select this option to enable or disable the STP global state here.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Spanning Tree Mode** are described below:

Parameter	Description
Spanning Tree Mode	Select the STP mode used here. Options to choose from are RSTP , and STP .

Click the **Apply** button to accept the changes made.

The fields that can be configured for **STP Traps** are described below:

Parameter	Description
STP New Root Trap	Select this option to enable or disable the STP new root trap option here.
STP Topology Change Trap	Select this option to enable or disable the STP topology change trap option here.

Click the **Apply** button to accept the changes made.

STP Port Settings

This window is used to view and configure the STP port settings.

To view the following window, click **L2 Features > Spanning Tree > STP Port Settings**, as shown below:

Figure 8-23 STP Port Settings window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Port Fast	Select the port fast option here. Options to choose from are Network , Disabled , and Edge . In the Network mode the port will remain in the non-port-fast state for three seconds. The port will change to the port-fast state if no BPDU is received and changes to the forwarding state. If the port received the BPDU later, it will change to the non-port-fast state. In the Disable mode, the port will always be in the non-port-fast state. It will always wait for the forward-time delay to change to the forwarding state. In the Edge mode, the port will directly change to the spanning-tree forwarding state when a link-up occurs without waiting for the forward-time delay. If the interface receives a BPDU later, its operation state changes to the non-port-fast state. By default, this option is Edge .

Click the **Apply** button to accept the changes made.

ERPS

Ethernet Ring Protection Switching (ERPS) is a system for preventing Layer 2 loops in an Ethernet ring topology. One link between Ring Protection Link (RPL) nodes is blocked and un-blocked in the event of a link failure elsewhere in the network. It uses G.8032 Ethernet Ring Protection (ERP) protocol, which is part ITU-T G.8032.

To view the following window, click **L2 Features > ERPS**, as shown below:

Figure 8-24 ERPS window

The fields that can be configured are described below:

Parameter	Description
Ring Name	Enter the name of the ERPS ring here.

Click the **Apply** button to accept the changes made.

Loopback Detection

The Loopback Detection (LBD) function is used to detect the loop created by a specific port. This feature is used to temporarily shut down a port on the switch when a CTP (Configuration Testing Protocol) packet has been looped back to the switch. When the switch detects CTP packets received from a port, this signifies a loop on the network. The switch will automatically block the port and send an alert to the administrator. The Loopback Detection port will restart (change to normal state) when the Loopback Detection Recover Time times out. The Loopback Detection function can be implemented on a range of ports at a time. The user may enable or disable this function using the drop-down menu.

To view the following window, click **L2 Features > Loopback Detection**, as shown below:

Figure 8-25 Loopback Detection window

The fields that can be configured for **Loopback Detection Global Settings** are described below:

Parameter	Description
Loopback Detection State	Select to enable or disable loopback detection. The default is Disabled .
Trap State	Select to enable or disable the loopback detection trap state. The default is Disabled .
Enabled VLAN ID List	This is the range of VLANs that Loopback Detection is enabled on. The range is from 1 to 4094.
Action	The action to perform when a CTP packet is detected on a port. The actions are as follows: Shutdown: shut the port down. None: perform no action.
Function Version	This is the version of Loopback Detection software running on the switch.
Mode	This is the Loopback Detection mode running on the switch. The modes are: Port-based: perform port-based Loopback Detection VLAN-based: perform VLAN-based Loopback Detection.
Interval (1-32767)	Set a Loop detection Interval between 1 and 32767 seconds. The default is 10seconds.
Recover Time (0, 60-1000000)	Time allowed (in seconds) for recovery when a Loopback is detected. The Loop Detection Recover Time can be set at 0

	seconds, or 60 to 1000000 seconds. Entering 0 will disable the Loop Detection Recover Time. The default is 60 seconds.
Loopback address type	Set a Loop detection packet use multicast or broadcast

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Loopback Detection Port Settings** are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
State	Select this option to enable or disable the state of the port.

Click the **Apply** button to accept the changes made.

Note: If Spanning Tree protocol is used, loopback detection will not be available. If Loopback Detection is enabled, the Spanning Tree protocol will not be available.

Link Aggregation

Understanding Port Trunk Groups

Port trunk groups are used to combine a number of ports together to make a single high-bandwidth data pipeline.

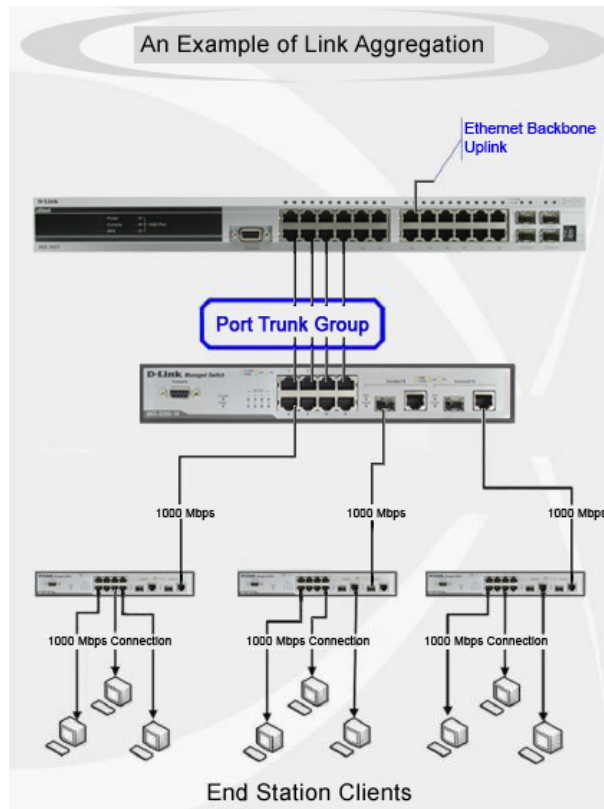

Figure 8-26 Example of Port Trunk Group

The switch treats all ports in a trunk group as a single port. Data transmitted to a specific host (destination address) will always be transmitted over the same port in a trunk group. This allows packets in a data stream to arrive in the same order they were sent.

Link aggregation allows several ports to be grouped together and to act as a single link. This gives a bandwidth that is a multiple of a single link's bandwidth.

Link aggregation is most commonly used to link a bandwidth intensive network device or devices, such as a server, to the backbone of a network.

All of the ports in the group must be members of the same VLAN, and their STP status, static multicast, traffic control; traffic segmentation and 802.1p default priority configurations must be identical. Further, the LACP aggregated links must all be of the same speed and should be configured as full duplex.

Load balancing is automatically applied to the ports in the aggregated group, and a link failure within the group causes the network traffic to be directed to the remaining links in the group.

The Spanning Tree Protocol will treat a link aggregation group as a single link, on the switch level. On the port level, the STP will use the port parameters of the Master Port in the calculation of port cost and in determining the state of the link aggregation group. If two redundant link aggregation groups are configured on the switch, STP will block one entire group; in the same way STP will block a single port that has a redundant link.

NOTE: If any ports within the trunk group become disconnected, packets intended for the disconnected port will be load shared among the other linked ports of the link aggregation group.

This window is used to view and configure the link aggregation settings.

To view the following window, click **L2 Features > Link Aggregation**, as shown below:

Figure 8-27 Link Aggregation window

The fields that can be configured for **Channel Group Information** are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Group ID	Enter the channel group number here. The system will automatically create the port-channel when a physical port first joins a channel group. An interface can only join one channel-group.
Mode	<p>Select the mode option here. Options to choose from are On, Active, and Passive. If the mode On is specified, the channel group type is static. If the mode Active or Passive is specified, the channel group type is LACP. A channel group can only consist of either static members or LACP members. Once the type of channel group has been determined, other types of interfaces cannot join the channel group.</p> <p>Active - Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so the group may be changed dynamically as needs require. In order to utilize the ability to change an aggregated port group, that is, to add or subtract ports from the group, at least one of the participating devices must designate LACP ports as active. Both devices must support LACP.</p> <p>Passive - LACP ports that are designated as passive cannot initially send LACP control frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, one end of the connection must have "active" LACP ports</p>

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete Member Port** button to remove the specific member port.

Click the **Delete Channel** button to remove the specific entry.

Click the **Channel Detail** button to view more detailed information about the channel.

After clicking the **Channel Detail** button, the following page will be available.

The screenshot displays the 'Port Channel' configuration window. It is divided into three main sections: 'Port Channel Information', 'Port Channel Detail Information', and 'Port Channel Neighbor Information'. The 'Port Channel Information' section shows 'Port Channel' as 1 and 'Protocol' as LACP. The 'Port Channel Detail Information' section contains a table with columns: Port, Working Mode, LACP State, Port Priority, and Port Number. The 'Port Channel Neighbor Information' section contains a table with columns: Port, Partner System ID, Partner PortNo, Partner Working Mode, and Partner Port Priority. A 'Note' section explains LACP states: bnd! (bundled), indep (independent), hot-sby (hot-standby), and down. A '<<Back' button is located in the bottom right corner.

Port	Working Mode	LACP State	Port Priority	Port Number
eth1	Active	down	255	1

Port	Partner System ID	Partner PortNo	Partner Working Mode	Partner Port Priority
eth1	00-00-00-00-00-00	0		0

Note:
LACP State:
bnd!: Port is attached to an aggregator and bundled with other ports.
indep: Port is in an independent state(not bundled but able to switch data traffic).
hot-sby: Port is in a hot-standby state.
down: Port is down.

<<Back

Figure 8-28 Port Channel window

Click the **Back** button to return to the previous window.

L2 Multicast Control

IGMP Snooping

Internet Group Management Protocol (IGMP) snooping allows the switch to recognize IGMP queries and reports sent between network stations or devices and an IGMP host.

IGMP Snooping Settings

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Settings**, as shown below:

Figure 8-29 IGMP Snooping Settings window

The field that can be configured for **Global Settings** is described below:

Parameter	Description
Global State	Select this option to enable or disable IGMP Snooping global state.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **VLAN Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable IGMP Snooping on the VLAN.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **VLAN Querier Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable IGMP Snooping on the VLAN.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Fast Leave Settings** are described below:

Parameter	Description
Fast Leave Settings	Select this option to enable or disable IGMP Snooping Fast Leave global state.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Fast Leave Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable IGMP Snooping Fast Leave on the VLAN.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

IGMP Snooping Groups Settings

This window is used to configure and view the IGMP snooping static group, and view IGMP snooping group.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Groups Settings**, as shown below:

Figure 8-30 IGMP Snooping Groups Settings

The fields that can be configured for **IGMP Snooping Static Groups Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID of the multicast group.
Group Address	Enter an IP multicast group address.
From Port / To Port	Select the appropriate port range used for the configuration here.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

IGMP Snooping Mrouter Settings

This window is used to configure and view the IGMP snooping Mrouter, and view IGMP snooping Mrouter.

To view the following window, click **L2 Features > L2 Multicast Control > IGMP Snooping > IGMP Snooping Mrouter Settings**, as shown below:

Figure 8-31 IGMP Mrouter Settings

The fields that can be configured for **IGMP Snooping Mrouter Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID of the multicast group.
From Port / To Port	Select the appropriate port range used for the configuration here.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

MLD Snooping

Multicast Listener Discovery (MLD) Snooping allows the switch to listen to IPv6 multicast traffic and forward it only to Layer 2 ports that have requested to participate in the multicast group.

MLD Snooping Settings

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Settings**, as shown below:

Figure 8-32 MLD Snooping Settings window

The field that can be configured for **Global Settings** is described below:

Parameter	Description
Global State	Select this option to enable or disable MLD Snooping global state.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **VLAN Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable MLD Snooping on the VLAN.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **VLAN Querier Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable MLD Snooping on the VLAN.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Fast Done Settings** are described below:

Parameter	Description
Fast Done	Select this option to enable or disable MLD Snooping Fast Done global state.

Click the **Apply** button to accept the changes made.

The fields that can be configured for **Fast Done Status Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID from 1 to 4094, and select to enable or disable MLD Snooping Fast Done on the VLAN.

Enter a page number and click the **Go** button to navigate to a specific page when multiple pages exist.

MLD Snooping Groups Settings

This window is used to configure and view the MLD Snooping static group, and view MLD Snooping group.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Groups Settings**, as shown below:

Figure 8-33 MLD Snooping Groups Settings

The fields that can be configured for **IGMP Snooping Static Groups Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID of the multicast group.
Group Address	Enter an IP multicast group address.
From Port / To Port	Select the appropriate port range used for the configuration here.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

MLD Snooping Mrouter Settings

This window is used to configure and view the MLD Snooping Mrouter, and view MLD Snooping Mrouter.

To view the following window, click **L2 Features > L2 Multicast Control > MLD Snooping > MLD Snooping Mrouter Settings**, as shown below:

Figure 8-34 MLD Snooping Mrouter Settings

The fields that can be configured for **IGMP Snooping Mrouter Settings** are described below:

Parameter	Description
VID	Enter a VLAN ID of the multicast group.
From Port / To Port	Select the appropriate port range used for the configuration here.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

Multicast Filtering

This window is used to view and configure the Layer 2 multicast filtering settings.

To view the following window, click **L2 Features > L2 Multicast Control > Multicast Filtering**, as shown below:

Figure 8-35 Multicast Filtering window

The fields that can be configured are described below:

Parameter	Description
Multicast Filter Mode	Select the multicast filter mode here. Options to choose from are Forward Unregistered , and Filter Unregistered . When selecting the Forward Unregistered option, registered multicast packets will be forwarded based on the forwarding table and all unregistered multicast packets will be flooded based on the VLAN domain. When selecting the Filter Unregistered option, registered packets will be forwarded based on the forwarding table and all unregistered multicast packets will be filtered.

Click the **Apply** button to accept the changes made.

LLDP

LLDP Global Settings

LLDP (Link Layer Discovery Protocol) provides IEEE 802.1AB standards-based method for switches to advertise themselves to neighbor devices, as well as to learn about neighbor LLDP devices.

This window is used to configure the LLDP global settings.

To view the following window, click **L2 Features > LLDP > LLDP Global Settings**, as shown below:

Figure 8-36 LLDP Global Settings window

The fields that can be configured for **LLDP Global Settings** are described below:

Parameter	Description
LLDP State	Select this option to enable or disable the LLDP feature
LLDP Trap State	Select this option to enable or disable the LLDP trap state.

Click the **Apply** button to accept the changes made.

LLDP Neighbor Port Information

This window is used to display the information learned from the neighbors. The switch receives packets from a remote station but is able to store the information as local.

To view the following window, click **L2 Features > LLDP > LLDP Neighbor Port Information**, as show below:

Figure 8-37 LLDP Neighbor Port Information window

9. Quality of Service (QoS)

802.1p Priority Port Rate Limiting

802.1p Priority

This window is used to view and configure the port's default CoS settings.

To view the following window, click **QoS > 802.1p Priority**, as shown below:

Figure 9-1 Port Default CoS window

The fields that can be configured for Port Scheduler Method are described below:

Parameter	Description
mode	Select 802.1p or DSCP
From Port / To Port	Select the appropriate port range used for the configuration here.
Scheduler Method	<p>SP - Denoting a Strict Priority scheduling will set the highest queue to be emptied first while the other queues will follow the weighted round-robin scheduling scheme</p> <p>WRR - Use the weighted round-robin (WRR) algorithm to handle packets in an even distribution in priority classes of service.</p>

Click the **Apply** button to accept the changes made.

The fields that can be configured Port Default CoS are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Default CoS	Select the default CoS option for the port(s) specified here. The priorities are Highest , High , Medium and Low .

Click the **Apply** button to accept the changes made.

Port Rate Limiting

This window is used to view and configure the port rate limiting settings.

To view the following window, click **QoS > Port Rate Limiting**, as shown below:

Figure 9-2 Port Rate Limiting window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Direction	Select the direction option here. Options to choose from are Input and Output . When Input is selected, the rate limit for ingress packets is configured. When Output is selected, the rate limit for egress packets is configured.
Rate Limit	Select the rate limit value here. When Direction is Input , this drop-down menu allows you to select data rate from 16Kbps to 512Mbps. When Direction is Output , this drop-down menu allows you to select data rate from 16Kbps to 512Mbps.

Click the **Apply** button to accept the changes made.

[Safeguard Engine Settings](#)
[Traffic Segmentation](#)
[Storm Control](#)
[DoS Attack Prevention Settings](#)
[Zone Defense Settings](#)
[SSL](#)

Safeguard Engine Settings

D-Link's Safeguard Engine is a robust and innovative technology that automatically throttles the impact of packet flooding into the switch's CPU. This function helps protect the Smart switch from being interrupted by malicious viruses or worm attacks.

This window is used to view and configure the safeguard engine settings.

To view the following window, click **Security > Safeguard Engine > Safeguard Engine Settings**, as shown below:

Figure 10-1 Safeguard Engine Settings window

The fields that can be configured for **Safeguard Engine Settings** are described below:

Parameter	Description
Safeguard Engine State	Select to enable or disable the safeguard engine feature here.

Traffic Segmentation

This window is used to view and configure the traffic segmentation settings. When the traffic segmentation forwarding domain is specified, packets received by the port will be restricted in Layer 2 packet forwarding to interfaces within the domain. When the forwarding domain of a port is empty, Layer 2 forwarding for packets received by the port is not restricted.

To view the following window, click **Security > Traffic Segmentation Settings**, as shown below:

Figure 10-1 Traffic Segmentation Settings window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the receiving port range used for the configuration here.
From Forward Port / To Forward Port	Select the forward port range used for the configuration here.

Click the **Add** button to add a new entry based on the information entered.

Click the **Delete** button to remove an entry based on the information entered.

Storm Control

This window is used to view and configure the storm control settings. Once a packet storm has been detected, the switch will drop packets coming into the switch until the storm has subsided.

To view the following window, click **Security > Storm Control**, as shown below:

Figure 10-2 Storm Control window

The fields that can be configured for **Storm Control Port Settings** are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Type	Select the type of storm attack that will be controlled here. Options to choose from are Broadcast , Multicast , and Unicast .
Rate Limit	Select a data rate from 512Kbps to 512Mbps.

Click the **Apply** button to accept the changes made.

DoS Attack Prevention Settings

This window is used to view and configure the Denial-of-Service (DoS) attack prevention settings. The following well-known DoS types which can be detected by most switches:

- **Land Attack:** This type of attack involves IP packets where the source and destination address are set to the address of the target device. It may cause the target device to reply to itself continuously.
- **Blat Attack:** This type of attack will send packets with the TCP/UDP source port equal to the destination port of the target device. It may cause the target device to respond to itself.
- **TCP-Null Scan:** This type of attack involves port scanning by using specific packets which contain a sequence number of 0 and no flags.
- **TCP-Xmas Scan:** This type of attack involves port scanning by using specific packets which contain a sequence number of 0 and the Urgent (URG), Push (PSH), and FIN flags.
- **TCPSYN-FIN:** This type of attack involves port scanning by using specific packets which contain SYN and FIN flags.

- **TCP SYN Src Port Less 1024:** This type of attack involves port scanning by using specific packets which contain source port 0 to 1023 and SYN flag.
- **Ping of Death Attack:** A ping of death is a type of attack on a computer that involves sending a malformed or otherwise a malicious ping to a computer. A ping is normally 64 bytes in size (many computers cannot handle a ping larger than the maximum IP packet size) which is 65535 bytes. The sending of a ping of this size can crash the target computer. Traditionally, this bug has been relatively easy to exploit. Generally, sending a 65536 byte ping packet is illegal according to networking protocol, but a packet of such a size can be sent if it is fragmented; when the target computer reassembles the packet, a buffer overflow can occur, which often causes a system crash.
- **All Types:** All of above types.

To view the following window, click **Security > DoS Attack Prevention Settings**, as shown below:

Figure 10-3 DoS Attack Prevention Settings window

The fields that can be configured for **DoS Attack Prevention Settings** are described below:

Parameter	Description
DoS Type Selection	Tick the DoS type option that will be prevented here.
State	Select to enable or disable the DoS attack prevention feature's global state here.
Action	Select the action that will be taken when the DoS attack was detected here. The only option to select here is Drop .

Click the **Apply** button to accept the changes made.

Zone Defense Settings

This window is used to view and configure the Zone Defense setting.

To view the following window, click **Security > Zone Defense Settings**, as shown below:

Figure 10-5 Zone Defense Settings window

The fields that can be configured for **Zone Defense Settings** are described below:

Parameter	Description
State	Select to enable or disable the Zone Defense feature's global state here.

Click the **Apply** button to accept the changes made.

SSL

Secure Sockets Layer (SSL) is a security feature that will provide a secure communication path between a host and client through the use of authentication, digital signatures and encryption.

SSL Global Settings

This window is used to view and configure the SSL feature's global settings.

To view the following window, click **Security > SSL > SSL Global Settings**, as shown below:

Figure 10-4 SSL Global Settings window

The fields that can be configured for **SSL Global Settings** are described below:

Parameter	Description
SSL Status	Select to enable or disable the SSL feature's global status here.

Click the **Apply** button to accept the changes made.

11. OAM

Cable Diagnostics

The cable diagnostics feature is designed primarily for administrators or customer service representatives to verify and test copper cables; it can rapidly determine the quality of the cables and the types of error.

To view the following window, click **OAM > Cable Diagnostics**, as shown below:

Figure 11-1 Cable Diagnostics window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.

Click the **Test** button to test the specific port.

Click the **Clear** button to clear all the information for the specific port.

Click the **Clear All** button to clear all the information in this table.

Note: The Cable Diagnostics feature is only supported on the copper ports on all DGS-1100 MP/MPP Series switches.

12. Monitoring

Statistics
Mirror Settings

Statistics

Port Counters

This window is used to display port counter statistics.

To view the following window, click **Monitoring > Statistics > Port Counters**, as show below:

Figure 12-1 Port Counters window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.

Tx OK: Number of packets transmitted successfully.

Rx OK: Number of packets received successfully.

Tx Error: Number of transmitted packets resulting in error.

Rx Error: Number of received packets resulting in error

Click the **Find** button to locate a specific entry based on the information entered.

Click the **Refresh** button to refresh the display table.

Click the **Clear** button to clear all the information for the specific port.

Click the **Clear All** button to clear all the information in this table.

Mirror Settings

This window is used to view and configure the mirror feature's settings. The switch allows users to copy frames transmitted and received on a port and redirect the copies to another port. Attach a monitoring device to the mirroring port, such as a sniffer, to view details about the packets passing through the first port. This is useful for network monitoring and troubleshooting purposes.

To view the following window, click **Monitoring > Mirror Settings**, as shown below:

Figure 12-2 Mirror Settings window

The fields that can be configured for **Mirror Settings** are described below:

Parameter	Description
Destination	Select one destination port from drop-down menu.
Source	Select From Port number and the To Port number as source port from drop-down menu. Lastly select the Frame Type option. Options to choose from as the Frame Type are Both , RX , and TX . When selecting Both , traffic in both the incoming and outgoing directions will be mirrored. When selecting RX , traffic in only the incoming direction will be mirrored. When selecting TX , traffic in only the outgoing direction will be mirrored.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to delete an existing mirror entry based on the information entered.

13. Green

Power Saving EEE

Power Saving

This window is used to configure the power saving settings of the switch.

To view the following window, click **Green>Power Saving**, as shown below:

Figure 13-1 Power Saving window

The fields that can be configured are described below:

Parameter	Description
Link Detection Power Saving	Select this option to enable or disable the link detection state. When enabled, a port which has a link down status will be turned off to save power to the switch. This will not affect the port's capabilities when the port status is link up.
Scheduled Port-shutdown Power Saving	Select this option to enable or disable applying the power saving by scheduled port shutdown.
Scheduled Hibernation Power Saving	Select this option to enable or disable applying the power saving by scheduled hibernation power.
Scheduled Dim-LED Power Saving	Select this option to enable or disable applying the power saving by scheduled dimming LEDs.
Administrative Dim-LED	Select this option to enable or disable the port LED function.
Type	Select the type of power saving. Option to choose from is Dim-LED or Hibernation .
Time Profile	If a Time Profile was previously created, select the desired profile from the drop down list.

Click the **Apply** button to accept the changes made for each individual section.

Click the **Delete** button to remove the specified entry.

After clicking the **Power Saving Shutdown Settings** tab, the following page will appear.

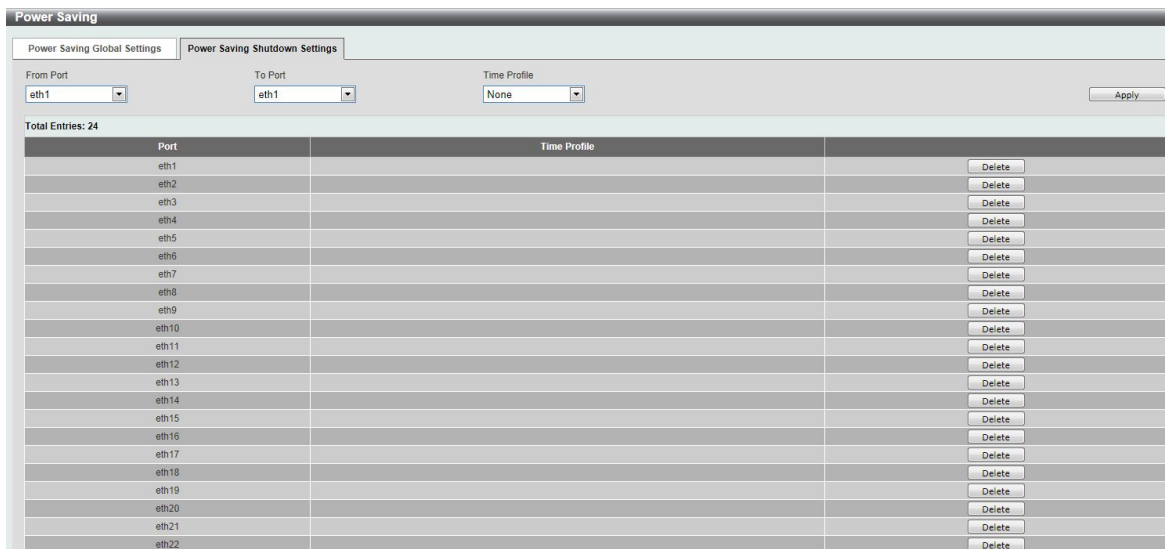

Figure 13-2 Power Saving Shutdown Settings window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
Time Range	If a Time Profile was previously created, select the desired profile from the drop down list.

Click the **Apply** button to accept the changes made.

Click the **Delete** button to remove the specified entry.

EEE

Energy Efficient Ethernet (EEE) is defined in IEEE 802.3az. It is designed to reduce the energy consumption of a link when no packets are being sent.

To view the following window, click **Green > EEE**, as shown below:

Figure 13-3 EEE window

The fields that can be configured are described below:

Parameter	Description
From Port / To Port	Select the appropriate port range used for the configuration here.
State	Select this option to enable or disable the state of this feature here.

Click the **Apply** button to accept the changes made.

Note: The EEE feature is only supported on the copper ports on all DGS-1100 MP/MPP Series switches.

14. ONVIF

Global Status
IP-Camera Information
NVR Information
IP-Cameras Icon

Global Status

ONVIF is a global standard for improving inter-operability between IP-based security products. It is an effort between various hardware and software vendors to define a specification for the exchange of information between physical security products. The DGS-1100 MP/MPP Series support the ONVIF protocol and its settings can be configured below.

The ONVIF Global Status page enables ONVIF support globally on the switch and allows you to configure ONVIF settings. It also displays global ONVIF statistics for the switch.

To view the following window, click **ONVIF > Global Settings**, as shown below:

Figure 14-1 ONVIF Global Status window

The fields that can be configured are described below:

Parameter	Description
Global State	Select this option to enable or disable ONVIF globally on the switch. This will over-write Auto Surveillance VLAN, QoS, and Power Saving settings.
VLAN ID (2-4094)	This is the VLAN that is used for surveillance devices on the switch and can be manually configured to be a VLAN created in the VLAN section of this document.
VLAN CoS	This is the VLAN Class of Service and can be set to a value between 0 and 7. It uses the IEEE 802.1p Priority Levels to classify traffic.
Discover Port (554,1025-65535)	This is the port that is used to discover ONVIF-compatible devices on the VLAN. The default is TCP port 554.
Trap State	Select this option to enable or disable SNMP traps for ONVIF. This SNMP host can be configured in the SNMP Global Settings section of this document.

Click the **Apply** button to accept the changes made.

IP-Camera Information

The IP-Camera Information page shows the devices that have been discovered through ONVIF. These are ONVIF-compatible devices that have been detected in the VLAN defined in the ONVIF Global Status page. The system probes for new IP-Cameras every 30 seconds.

To view the following window, click **ONVIF > IP-Camera Information**, as shown below:

The screenshot shows a window titled "IP-Camera Information" with a sub-header "IP-Camera Information". Below the header, it states "Total Entries Discovered: 2". A table lists the discovered cameras with columns for Port, IP Address, Model, Location, Manufacturer, Traffic, Description, and Throughput. Each row has "More Detail" and "Edit" buttons. A note at the bottom states: "Note: System probes IP-Camera every 30s."

Port	IP Address	Model	Location	Manufacturer	Traffic	Description	Throughput		
eth19	10.90.90.73	IPC-HFW4631M-11	country/china	Dahua	186909.00M		5.00M	More Detail	Edit
eth21	10.90.90.202	IPC-HFW4631M-11	country/china	Dahua	65095.00M		6.00M	More Detail	Edit

Figure 14-2 IP-Camera Information window

IPC Settings

This menu is accessible by clicking on the **Edit** button on the IP-Camera Information page.

The fields that can be configured for **IPC Settings** are described below:

Parameter	Description
IPC State	Select the state of the IP-Camera, either Enabled or Disabled .
Description	Use this to enter a description for the IP-Camera. This will be displayed on the IP-Camera Information page.

Click the **Apply** button to accept the changes made.

NVR Information

This is a list of the NVR devices that have been detected in the ONVIF VLAN. The switch port, IP address of the device, the number of IP-Cameras connected, throughput, group number, and port description. A group number will be assigned if multiple ONVIF devices have been recognized on a port.

To view the following window, click **ONVIF > NVR Information**, as shown below:

The screenshot shows a window titled "NVR Information" with a sub-header "NVR Information". Below the header, it states "Total Entries Discovered: 2". A table lists the discovered NVRs with columns for Port, IP Address, IPC Number, Throughput, Group, and Description. Each row has "IPC List" and "Edit" buttons.

Port	IP Address	IPC Number	Throughput	Group	Description		
15	10.90.90.15	4	10Mbps	Group 1	nvr1	IPC List	Edit
17	10.90.90.17	1	2Mbps	Group 2		IPC List	Edit

Figure 14-3 NVR Information window

The fields that can be configured for **NVR Information** are described below:

Parameter	Description
Description	Edit this by pressing the Edit button next to the entry in the table. This is the description for the NVR that has been detected as being connected to the port.

Click the **Apply** button to accept the changes made.

IP-Camera Icon

This page can be backup or uploaded to IP-Camera Icon (users can customize).

To view the following window, click **ONVIF > IP-Camera Icon**, as shown below:

Figure 14-4 IP-Camera Icon window

The fields that can be configured for **IP-Camera** are described below:

Parameter	Description
Backup	Backup the icon to local
Upload	Upload the local icon to the switch
Model Name	You can name the IP-Camera Icon
Upload Icon File	Name upload files

Click **Apply** to make the configurations take effect.

Click **view** to see the icon.

Click **delete** to delete the icon.

Note: Please click the save button of tool bar after upload IPC icons, or missing them when reboot system.

Note: Please click the save button of tool bar after add/delete IPC icons, or missing them when reboot system.

15. Save and Tools

[Save Configuration](#)
[Firmware Information](#)
[Firmware Upgrade & Backup](#)
[Configuration Restore & Backup](#)
[Log Backup](#)
[Ping](#)
[Reset](#)
[Reboot System](#)

Save Configuration

This window is used to save the running configuration to the start-up configuration of the switch. This is to prevent the loss of configuration in the event of a power failure.

To view the following window, click **Save > Save Configuration**, as shown below:

Figure 15-1 Save Configuration window

Click the **Apply** button to save the configuration to the switch's flash memory.

Firmware Information

This window is used to show firmware information.

To view the following window, click **Tools > Firmware Information**, as shown below:

Image ID	Version	Size (B)	Update Time	Boot UP
1	R2.00.04	7904720	2000-01-01 01:02:15	Boot UP
*2c	R2.00.04	7904624	2000-01-01 17:19:33	Boot UP

c: Current boot up firmware
*: Boot up firmware

Figure 15-2 Firmware Information window

Boot Up: Clicking the **Boot Up** button will set that firmware image as the active image to use upon the next system start up.

Note: Changing the firmware only happens after the switch has been manually rebooted. In order to boot with the newly selected firmware, make sure that the switch is rebooted.

Firmware Upgrade & Backup

Note: When upgrading the firmware on the DGS-1100 MP/MPP Series switch, only the image not currently active can be upgraded. All DGS-1100 MP/MPP Series switches come with two images, however only one can be active at any time. (e.g. If image 1 is currently in use, only image 2 can be upgraded, and vice versa.)

Note: If the switch is in HTTPS mode, the firmware or configuration cannot be

upgraded using regular HTTP.

Firmware Upgrade from HTTP

This window is used to initiate a firmware upgrade from a local PC using HTTP.

To view the following window, click **Tools > Firmware Upgrade & Backup > Firmware Upgrade from HTTP**, as shown below:

Figure 15-3 Firmware Upgrade from HTTP window

The fields that can be configured are described below:

Parameter	Description
Source File	Enter the source filename and path of the firmware file located on the local PC. Alternatively click the Choose Browse button to navigate to the location of the firmware file located on the local PC.

Click the **Apply** button to initiate the firmware upgrade.

Firmware Upgrade from TFTP

This window is used to initiate a firmware upgrade from a TFTP server.

To view the following window, click **Tools > Firmware Upgrade & Backup > firmware Upgrade from TFTP**, as shown below:

Figure 15-4 Firmware Upgrade from TFTP window

The fields that can be configured are described below:

Parameter	Description
TFTP Server IP	Enter the TFTP server's IPv4 address here.
Source File	Enter the source filename and path of the firmware file located on the TFTP server here.

Click the **Upgrade** button to initiate the firmware upgrade.

Firmware Backup to HTTP

This window is used to initiate a firmware backup to a local PC using HTTP.

To view the following window, click **Tools > Firmware Upgrade & Backup > Firmware Backup to HTTP**, as shown below:

Figure 15-5 Firmware Backup to HTTP window

The fields that can be configured are described below:

Parameter	Description
Source	Select the source image to use for the firmware backup.

Click the **Apply** button to initiate the firmware backup.

Firmware Backup to TFTP

This window is used to initiate a firmware backup to a TFTP server.

To view the following window, click **Tools > Firmware Upgrade & Backup > Firmware Backup to TFTP**, as shown below:

Figure 15-6 Firmware Backup to TFTP window

The fields that can be configured are described below:

Parameter	Description
TFTP Server IP	Enter the TFTP server's IPv4 address here.
Source	Select the source image to use for the firmware backup.
Destination File	Enter the destination path and location where the firmware file should be stored on the TFTP server.

Click the **Backup** button to initiate the firmware backup.

Configuration Restore & Backup

Configuration Restore from HTTP

This window is used to initiate a configuration restore from a local PC using HTTP.

Note: If the switch is in HTTPS mode, the firmware or configuration cannot be upgraded using regular HTTP.

To view the following window, click **Tools > Configuration Restore & Backup > Configuration Restore from HTTP**, as shown below:

Figure 15-7 Configuration Restore from HTTP window

The fields that can be configured are described below:

Parameter	Description
Source File	Enter the source filename and path of the configuration file located on the local PC. Alternatively click the Choose File button to navigate to the location of the configuration file located on the local PC.

Click the **Apply** button to initiate the configuration restore.

Click **Effective immediately (running-config)** to have the uploaded configuration loaded immediately.

Click **Take effect after the next boot (startup-config)** to load the configuration after the switch has been rebooted.

Configuration Restore from TFTP

This window is used to initiate a configuration restore from a TFTP server.

To view the following window, click **Tools > Configuration Restore & Backup > Configuration Restore from TFTP**, as shown below:

Figure 15-8 Configuration Restore from TFTP window

The fields that can be configured are described below:

Parameter	Description
TFTP Server IP	Enter the TFTP server's IPv4 address here.
Source File	Enter the source filename and path of the configuration file

	located on the TFTP server here.
--	----------------------------------

Click the **Restore** button to initiate the configuration restore.

Click **Effective immediately (running-config)** to have the uploaded configuration loaded immediately.

Click **Take effect after the next boot (startup-config)** to load the configuration after the switch has been rebooted.

Configuration Backup to HTTP

This window is used to initiate a configuration file backup to a local PC using HTTP.

To view the following window, click **Tools > Configuration Restore & Backup > Configuration Backup to HTTP**, as shown below:

Figure 15-9 Configuration Backup to HTTP window

Select **Include username password** to save the switch user accounts and passwords to the backup file.

Select **Exclude username password** to save the switch user accounts and passwords to the backup file.

Click the **Backup** button to initiate the configuration file backup.

Configuration Backup to TFTP

This window is used to initiate a configuration file backup to a TFTP server.

To view the following window, click **Tools > Configuration Restore & Backup > Configuration Backup to TFTP**, as shown below:

Figure 15-10 Configuration Backup to TFTP window

The fields that can be configured are described below:

Parameter	Description
TFTP Server IP	Enter the TFTP server's IPv4 address here.
Destination File	Enter the destination path and location where the configuration file should be stored on the TFTP server.

Select **Include username password** to save the switch user accounts and passwords to the backup file.

Select **Exclude username password** to save the switch user accounts and passwords to the backup file.

Click the **Backup** button to initiate the configuration file backup.

Log Backup

Log Backup to HTTP

This window is used to initiate a system log backup to a local PC using HTTP.

To view the following window, click **Tools > Log Backup > Log Backup to HTTP**, as shown below:

Figure 15-11 Log Backup to HTTP window

Click the **Apply** button to initiate the system log backup.

Log Backup to TFTP

This window is used to initiate a system log backup to a TFTP server.

To view the following window, click **Tools > Log Backup > Log Backup to TFTP**, as shown below:

Figure 15-12 Log Backup to TFTP window

The fields that can be configured are described below:

Parameter	Description
TFTP Server IP	Enter the TFTP server's IPv4 address here.
Destination File	Enter the destination path and location where the configuration file should be stored on the TFTP server

Click the **Backup** button to initiate the system log backup.

Ping

Ping is a small program that sends ICMP Echo packets to the IP address you specify. The destination node then responds to or “echoes” the packets sent from the switch. This is very useful to verify connectivity between the switch and other nodes on the network.

To view the following window, click **Tools > Ping**, as shown below:

The screenshot shows a window titled "Ping" with a sub-section "IPv4 Ping". It contains three input fields: "Target IPv4 Address" (empty), "Ping Times (1-255)" (set to 4) with a checked "Infinite" checkbox, and "Timeout (1-99)" (set to 4) with a "sec" label. A "Start" button is located at the bottom right.

Figure 15-13 Ping window

The fields that can be configured for **IPv4 Ping** are described below:

Parameter	Description
Target IPv4 Address	Select and enter an IP address to be pinged.
Ping Times	Enter the number of times desired to attempt to Ping the IPv4 address configured in this window. Users may enter a number of times between 1 and 255. Tick the Infinite check box to keep sending ICMP Echo packets to the specified IP address until the program is stopped.
Timeout	Select a timeout period between 1 and 99 seconds for this Ping message to reach its destination. If the packet fails to find the IP address in this specified time, the Ping packet will be dropped.

After clicking the **Start** button in **IPv4 Ping** section, the following **IPv4 Ping Result** section will appear:

The screenshot shows a window titled "Ping" with a sub-section "IPv4 Ping Result". It displays the following text in a text area:

```
[1] reply from 192.168.100.129: time=10.0 ms
[2] reply from 192.168.100.129: time=0.0 ms
[3] reply from 192.168.100.129: time=10.0 ms
[4] reply from 192.168.100.129: time=0.0 ms
[5] reply from 192.168.100.129: time=0.0 ms
[6] reply from 192.168.100.129: time=0.0 ms
[7] reply from 192.168.100.129: time=0.0 ms
Ping Statistics for 192.168.100.129
Packets: Sent =7, Received =7, Lost =0
```

At the bottom of the window, there are "Stop" and "Back" buttons.

Figure 15-14 Ping - IPv4 Ping Result window

Click the **Stop** button to halt the Ping Test.

Click the **Back** button to return to the IPv4 Ping section.

Reset

This window is used to reset the switch’s configuration to the factory default settings.

To view the following window, click **Tools > Reset**, as shown below:

Figure 15-15 Reset window

Select **The Switch will be reset to its factory defaults including IP address and stacking information, and the will save, reboot** option to reset the switch's configuration to its factory default settings.

Select **The Switch will be reset to its factory default except IP address, and then will save, reboot** option to reset the switch's configuration to its factory default settings. This option will exclude the IP address from being changed.

Select **The Switch will be reset to its factory defaults including IP address** option to reset the switch's configuration to its factory default settings.

Click the **Apply** button to initiate the factory default reset and reboot the switch.

NOTE: Performing a factory reset in one version of the interface (Standard Mode or Surveillance Mode) will cause settings to be reset in the other version of the interface.

Reboot System

This window is used to reboot the switch and alternatively save the configuration before doing so. To view the following window, click **Tools > Reboot System**, as shown below:

Figure 15-16 Reboot System window

When rebooting the switch, any configuration changes that was made during this session, will be lost unless the **Yes** option is selected when asked to save the settings.

Click the **Reboot** button to alternatively save the settings and reboot the switch.

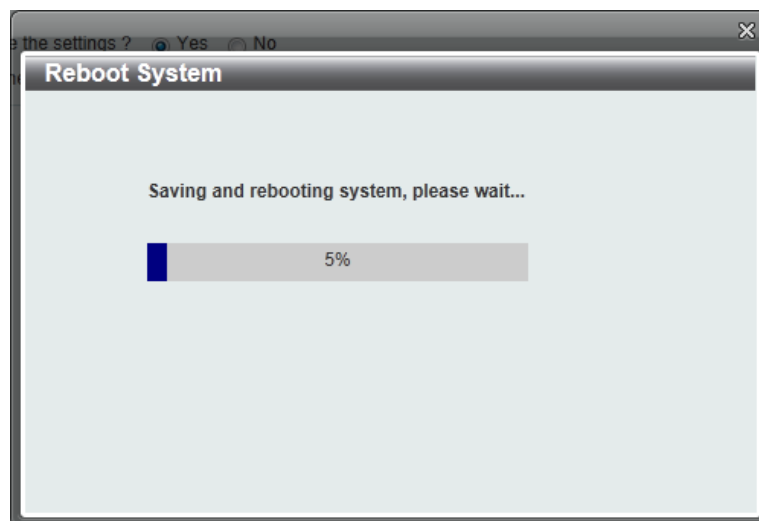

Figure 15-17 Reboot System – Rebooting window

16. Appendix A - Ethernet Technology

This chapter will describe the features of the D-Link DGS-1100 MP/MPP Series switch and provide some background information about Ethernet/Fast Ethernet/Gigabit Ethernet switching technology.

Gigabit Ethernet Technology

Gigabit Ethernet is an extension of IEEE 802.3 Ethernet utilizing the same packet structure, format, and support for CSMA/CD protocol, full duplex, and management objects, but with a tenfold increase in theoretical throughput of over 100-Mbps Fast Ethernet and a hundredfold increase over 10-Mbps Ethernet. Since it is compatible with all 10-Mbps and 100-Mbps Ethernet environments, Gigabit Ethernet provides a straightforward upgrade without wasting existing investments in hardware, software, or trained personnel.

The increased speed and extra bandwidth offered by Gigabit Ethernet is essential to help solving network bottlenecks that frequently develop as more advanced computer users and newer applications continue to demand greater network resources. Upgrading key components, such as backbone connections and servers to Gigabit Ethernet technology can greatly improve network response times as well as significantly speed up the traffic between subnets.

Gigabit Ethernet enables fast optical fiber connections to support video conferencing, complex imaging, and similar data-intensive applications. Likewise, since data transfers occur 10 times faster than Fast Ethernet, servers outfitted with Gigabit Ethernet NIC's are able to perform 10 times the number of operations in the same amount of time.

In addition, the phenomenal bandwidth delivered by Gigabit Ethernet is the most cost-effective method to take advantage of today and tomorrow's rapidly improving switching and routing internetworking technologies. And with expected advances in the coming years in silicon technology and digital signal processing that will enable Gigabit Ethernet to eventually operate over unshielded twisted-pair (UTP) cabling, outfitting your network with a powerful 1000-Mbps-capable backbone/server connection which will create a flexible foundation for the next generation of network technology products.

Fast Ethernet Technology

The growing importance of LANs and the increasing complexity of desktop computing applications are fueling the need for high performance networks. A number of high-speed LAN technologies have been proposed to provide greater bandwidth and improve client/server response times. Among them, 100BASE-T (Fast Ethernet) provides a non-disruptive, smooth evolution from the current 10BASE-T technology. The non-disruptive and smooth evolution nature, and the dominating potential market base, virtually guarantees cost-effective and high performance Fast Ethernet solutions.

100Mbps Fast Ethernet is a standard specified by the IEEE 802.3 LAN committee. It is an extension of the 10Mbps Ethernet standard with the ability to transmit and receive data at 100Mbps, while maintaining the CSMA/CD Ethernet protocol. Since the 100Mbps Fast Ethernet is compatible with all other 10Mbps Ethernet environments, it provides a straightforward upgrade and utilizes existing investments in hardware, software, and personnel training.

Switching Technology

Another approach to push beyond the limits of Ethernet technology is the development of switching technology. A switch bridges Ethernet packets at the MAC address level of the Ethernet protocol transmitting among connected Ethernet or Fast Ethernet LAN segments.

Switching is a cost-effective way of increasing the total network capacity available to users on a local area network. A switch increases capacity and decreases network loading by dividing a local area network into different segments which won't compete with each other for network transmission capacity.

The switch acts as a high-speed selective bridge between the individual segments. The switch, without interfering with any other segments, automatically forwards traffic that needs to go from one segment to another. By doing this the total network capacity is multiplied, while still maintaining the same network cabling and adapter cards.

17. Appendix B - Technical Specifications

Hardware Specifications

Key Components / Performance

- › Switching Capacity:
 - DGS-1100-10MP: 20Gbps
 - DGS-1100-10MPP: 20Gbps
 - DGS-1100-26MP: 52Gbps
 - DGS-1100-26MPP: 52Gbps
- › Max. Forwarding Rate:
 - DGS-1100-10MP: 14.88Mpps
 - DGS-1100-10MPP: 14.88Mpps
 - DGS-1100-26MP: 38.69Gbps
 - DGS-1100-26MPP: 38.69Gbps
- › Forwarding Mode: Store and Forward
- › Packet Buffer memory:
 - DGS-1100-10MP: 4.1Mbits
 - DGS-1100-10MPP: 4.1Mbits
 - DGS-1100-26MP: 4.1Mbits
 - DGS-1100-26MPP: 4.1Mbits
- › Flash Memory: 32M Byte

Port Functions

- › 10/100/1000BaseTX ports compliant with the following standards:
 - IEEE 802.3
 - IEEE 802.3u
 - IEEE 802.3ab
 - IEEE802.3at
 - IEEE802.3af
 - IEEE802.3bt (DGS-1100 MPP Series only)
 - Supports Full/half-Duplex operations at 10/100Mbps
 - Supports Full-Duplex operation at 1000Mbps
 - Supports IEEE 802.3x Flow Control
 - Support Auto-Negotiation
 - Compliant to IEEE 802.3az Energy Efficiency Ethernet.
- › SFP ports compliant with the following standards:
 - IEEE 802.3u compliance
 - IEEE 802.3z compliance

Physical & Environment

- › Power input:100~240 VAC, 50/60Hz, internal universal power supply
- › Acoustic Value:
 - DGS-1100-10MP: 51.9 dB
 - DGS-1100-10MPP: 51.9 dB
 - DGS-1100-26MP: 53.7 dB
 - DGS-1100-26MPP: 53.7 dB
- › Operation Temperature: -10~55°C
- › Storage Temperature: -20~70°C
- › Operation Humidity: 0%~95% RH
- › Storage Humidity: 0%~95% RH

Emission (EMI) Certifications

- › FCC class A
- › CE Class A
- › VCCI Class A
- › BSMI
- › CCC

Safety Certifications

- › CUL, LVD, CB, CCC, BSMI

Features

L2 Features

- › 8K MAC address
- › Loopback Detection
- › Port Mirroring
- › Link Aggregation
- › Cable Diagnostics
- › Spanning Tree
- › Ethernet Ring Protection Switching (ERPS)

L2 Multicasting

- › IGMP Snooping

VLAN

- › 802.1Q VLAN standard
- › Port-Based VLAN
- › Surveillance VLAN
- › Voice VLAN:
- › Asymmetric VLAN

Quality of Service (QoS)

- › 802.1p priority
- › 4 queues
- › Bandwidth Control

Security

- › Storm Control
- › DoS Attack Prevention
- › SSL
- › D-Link Safeguard

Management

- › Web-based GUI or D-Link Network Assistant
- › Configuration backup/restoration via Web-based management
- › Firmware backup & upgrade via Web-based management
- › Reset, Reboot system
- › Factory reset by pressing reset button
- › SNMP, LLDP, Dual Image, 2 level user account, Sntp

Power Saving

- › IEEE 802.3az Compliant (Energy Efficient Ethernet)
- › D-Link Green Technologies
 - Power saving by link status
 - Power Saving by LED Shut-Off
 - Power Saving by Port Shut-Off
 - Power Saving by System Hibernation

Surge Protection

- › All PoE ports support 2KV surge protection

18. Appendix C –Rack mount Instructions

Safety Instructions - Rack Mount Instructions - The following or similar rack-mount instructions are included with the installation instructions:

A) Elevated Operating Ambient - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature specified by the manufacturer.

B) Reduced Air Flow - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

C) Mechanical Loading - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

D) Circuit Overloading - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

E) Reliable Earthing - Reliable earthing of rack-mounted equipment should be maintained. Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips)
